# Logical Approach to Physical Data Independence and Query Compilation

**Future Directions** 

David Toman

D.R. Cheriton School of Computer Science University of Waterloo

< ロ > < 同 > < 臣 > < 臣 > -

- computationally better query operators
  - $\Rightarrow$  merge-join via *finger* data structures
  - $\Rightarrow$  intermediate results via additional physical design

(incremental compilation?)

computationally better query operators

- $\Rightarrow$  merge-join via *finger* data structures ( $\sqrt{}$ )
- $\Rightarrow$  intermediate results via additional physical design

(incremental compilation?)

computationally better query operators

- $\Rightarrow$  merge-join via *finger* data structures ( $\sqrt{}$ )
- $\Rightarrow$  intermediate results via additional physical design

(incremental compilation?)

- computationally better schema language (e.g., DLs)
  - $\Rightarrow$  what to do about queries? (parametric analysis?)

computationally better query operators

- $\Rightarrow$  merge-join via *finger* data structures ( $\sqrt{}$ )
- $\Rightarrow$  intermediate results via additional physical design

(incremental compilation?)

- computationally better schema language (e.g., DLs)
  - $\Rightarrow$  what to do about queries? (parametric analysis?)
- high(re) performance query compilation

computationally better query operators

- $\Rightarrow$  merge-join via *finger* data structures ( $\sqrt{}$ )
- $\Rightarrow$  intermediate results via additional physical design

(incremental compilation?)

 $\Rightarrow$  general *physical design* adviser (ala index adviser)

computationally better schema language (e.g., DLs)

 $\Rightarrow$  what to do about queries? (parametric analysis?)

- bigh(re) performance query compilation
- diagnostic features/explanations (why doesn't this query compile?)

computationally better query operators

- $\Rightarrow$  merge-join via *finger* data structures ( $\sqrt{}$ )
- $\Rightarrow$  intermediate results via additional physical design

(incremental compilation?)

 $\Rightarrow$  general *physical design* adviser (ala index adviser)

computationally better schema language (e.g., DLs)

 $\Rightarrow$  what to do about queries? (parametric analysis?)

- high(re) performance query compilation
- diagnostic features/explanations (why doesn't this query compile?)
- additional features
  - $\Rightarrow$  (better) updates
  - $\Rightarrow$  transaction management (locking, recovery)

computationally better query operators

- $\Rightarrow$  merge-join via *finger* data structures ( $\sqrt{}$ )
- $\Rightarrow$  intermediate results via additional physical design

(incremental compilation?)

 $\Rightarrow$  general *physical design* adviser (ala index adviser)

computationally better schema language (e.g., DLs)

 $\Rightarrow$  what to do about queries? (parametric analysis?)

- bigh(re) performance query compilation
- diagnostic features/explanations (why doesn't this query compile?)
- additional features
  - $\Rightarrow$  (better) updates
  - $\Rightarrow$  transaction management (locking, recovery)
- beyond FOL: synthesis of iterators for APs (e.g., inductive types)

 $\Rightarrow$  interaction with interpolation/query compilation?
