MVC / MVP

Dependency Injection

Reid Holmes

Background

- ▶ MVC started w/ Smalltalk-80
- ▶ Java UI frameworks & EJBs reignited interest
- ▶ Also prevalent in GWT and .NET development

MVC Motivation

- ▶ UI changes more frequently than business logic
 - ▶ e.g., layout changes (esp. in web applications)
- ▶ The same data is often displayed in different ways
 - ▶ e.g., table view vs chart view
 - ▶ The same business logic can drive both
- ▶ Designers and developers are different people
- ▶ Testing UI code is difficult and expensive
- ▶ Main Goal: Decouple models and views
 - ▶ Increase maintainability/testability of system
 - ▶ Permit new views to be developed

Model

- ▶ Contains application data
 - ▶ This is often persisted to a backing store
- ▶ Does not know how to present itself
- ▶ Is domain independent
- ▶ Are often Subjects in the Observer pattern

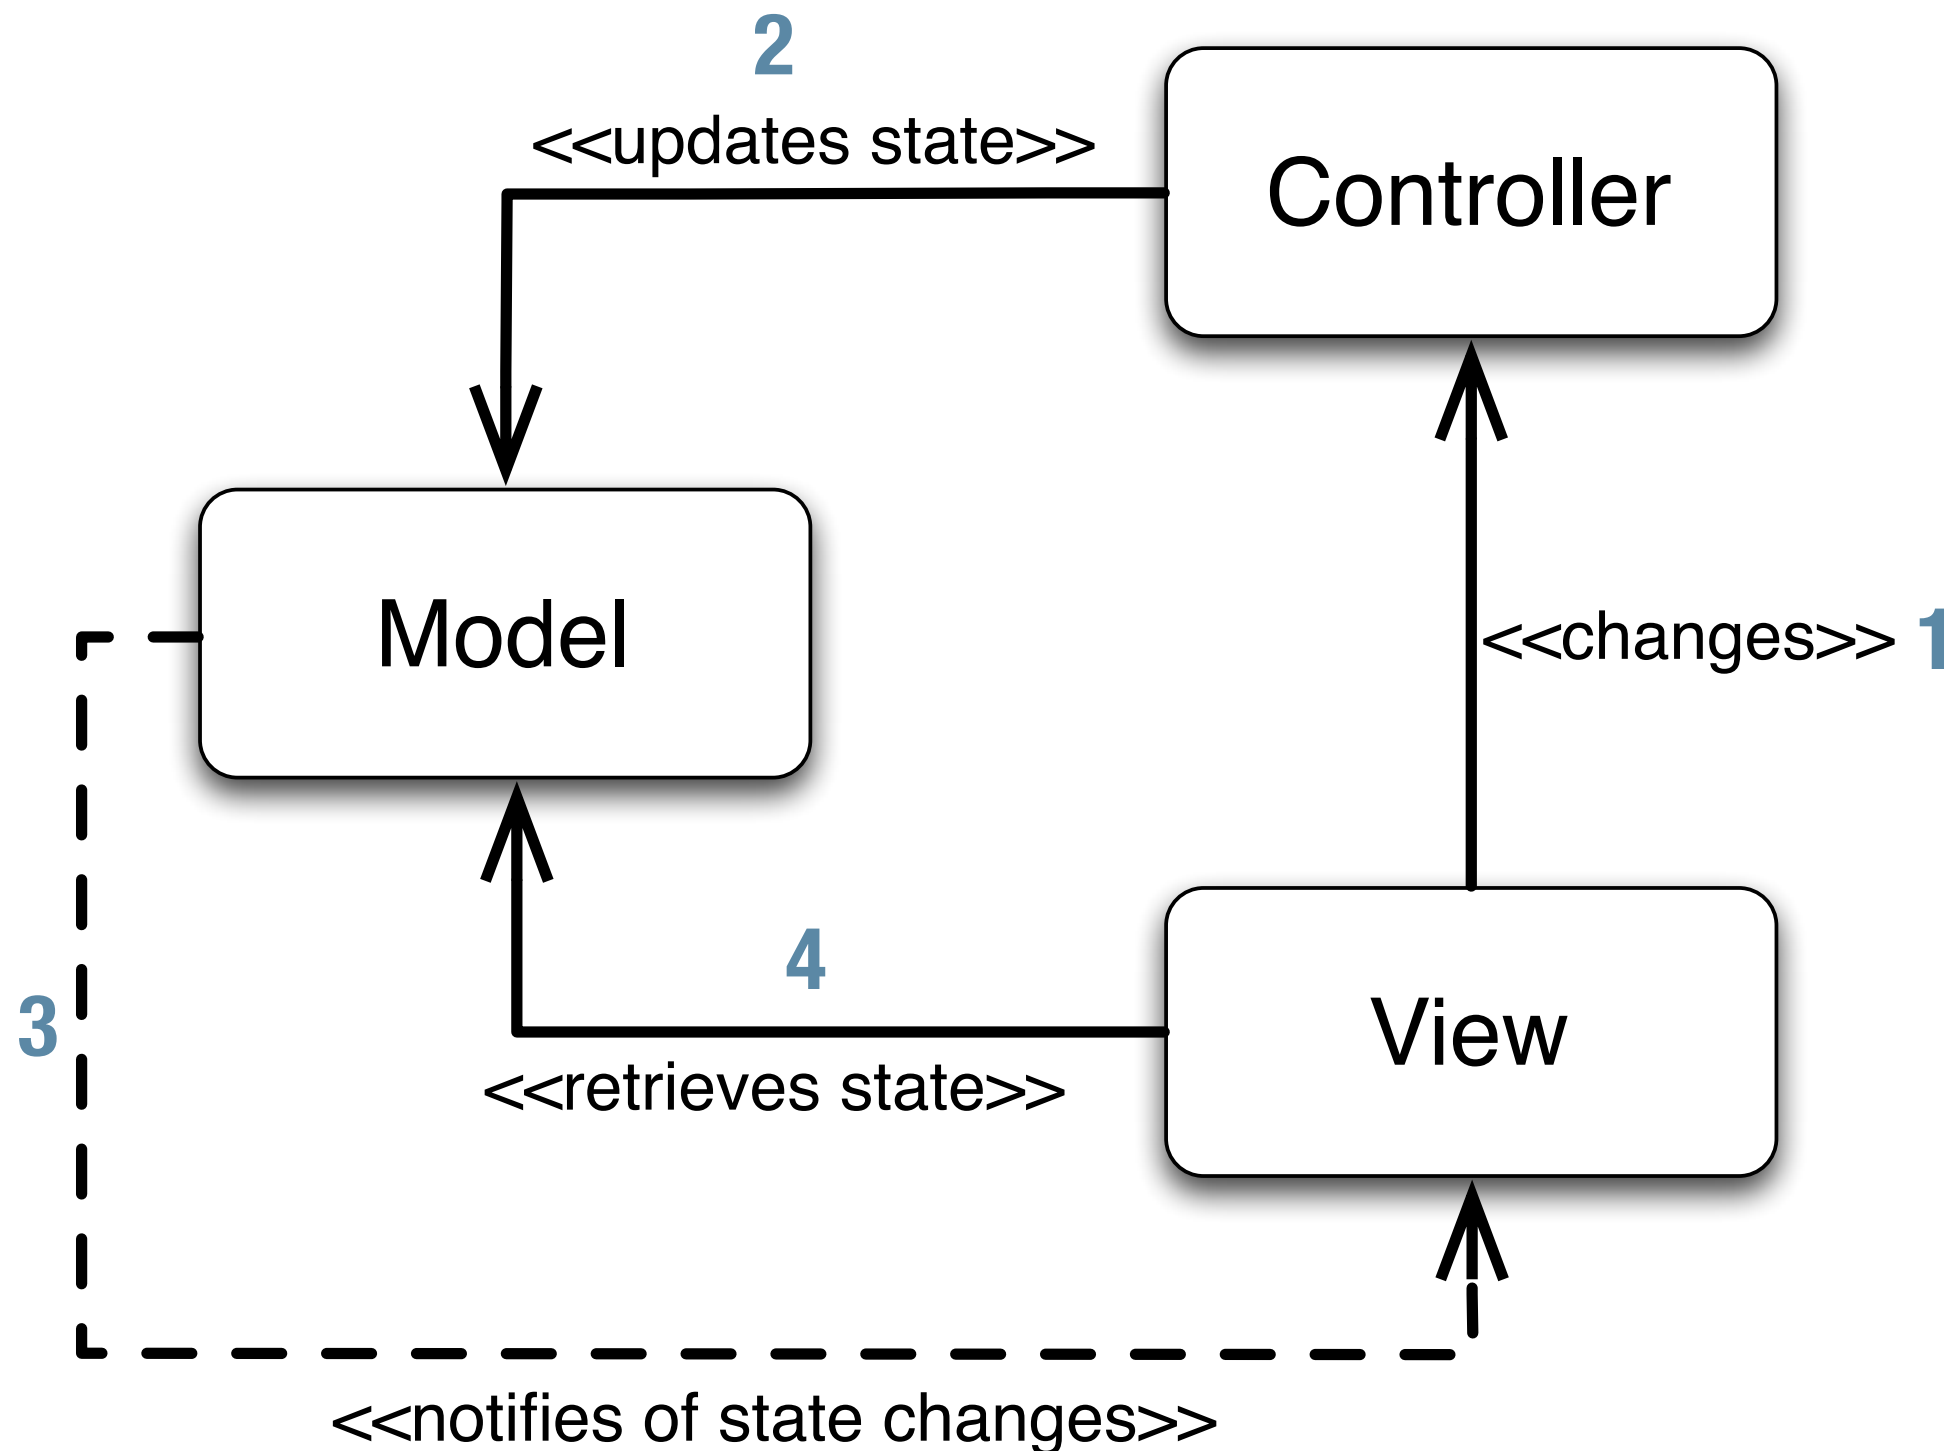

View

- ▶ Presents the model to the user
- ▶ Allows the user to manipulate the data
- ▶ Does not store data
- ▶ Is configurable to display different data

Controller

- ▶ Glues Model and View together
- ▶ Updates the view when the Model changes
- ▶ Updates the model when the user manipulates the view
- ▶ Houses the application logic
- ▶ Loose coupling between Model and others
- ▶ View tightly cohesive with its Controller

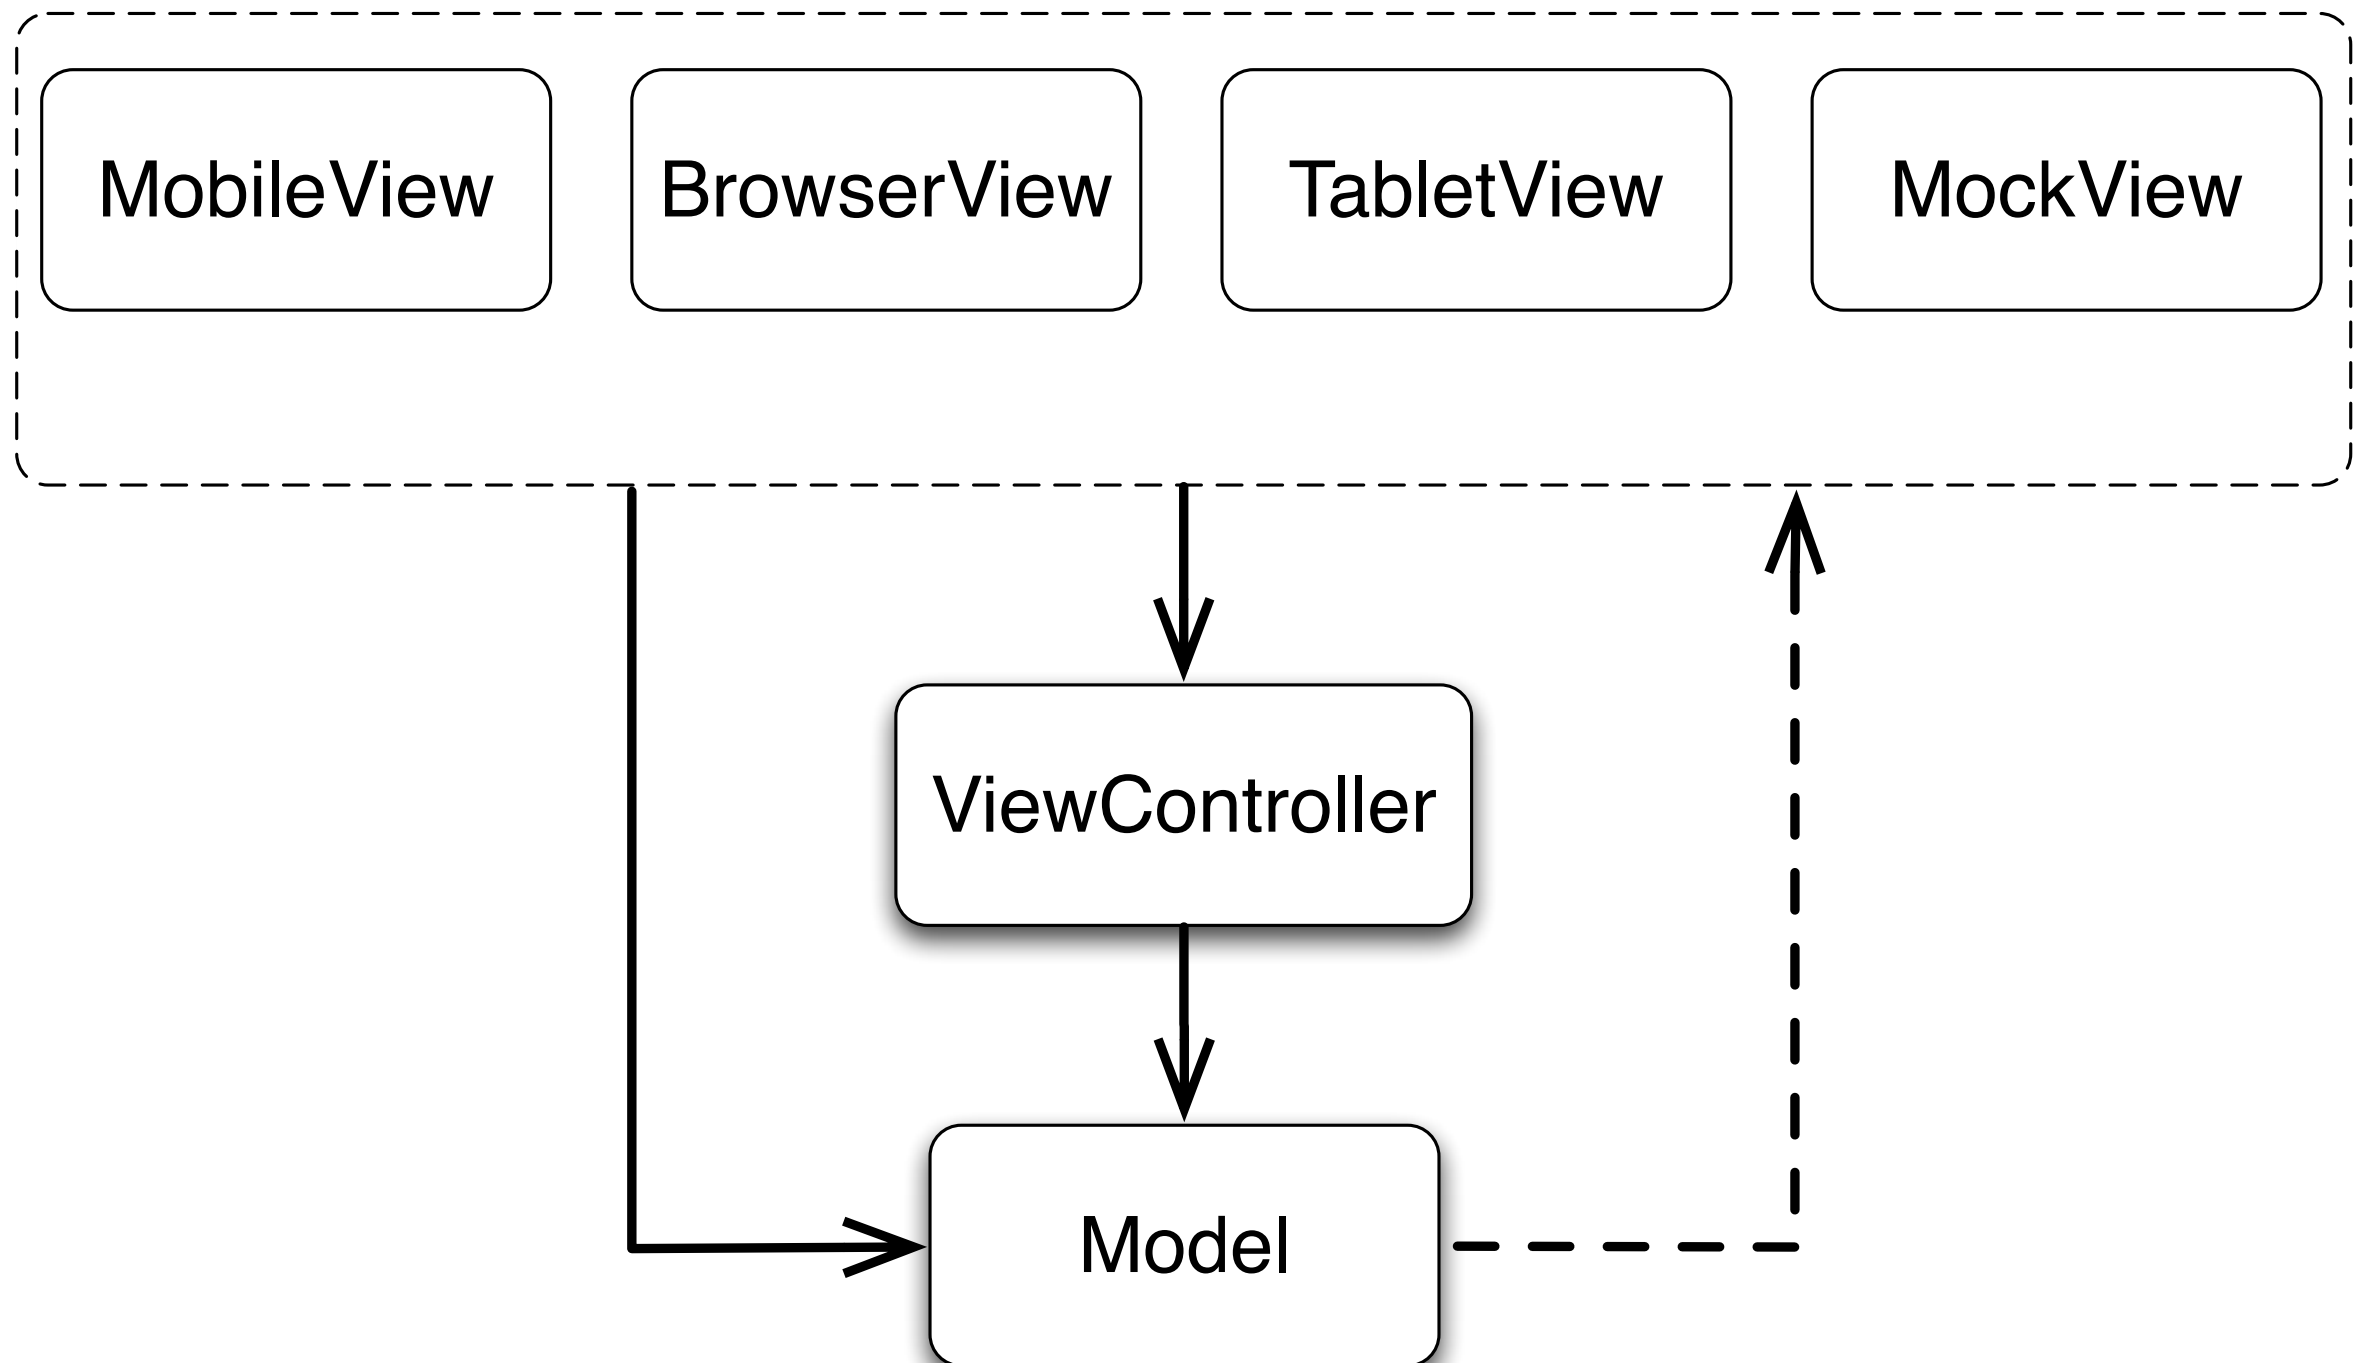

Abstract topology

Concrete topology

```
Factory f = GWT.create(Factory.class);  
ViewController c = new ViewController();  
View v = f.createView(c);
```

[gwt.xml maps Factory.class
to the right type]

Interaction mechanism

- ▶ User interacts with the UI (View)
- ▶ UI (View) notifies controller of changes
- ▶ Controller handles notifications, processing them into actions that can be performed on the model
- ▶ Controller modifies the model as required
- ▶ If the model changes, it fires modification events
- ▶ The view responds to the modification events

Benefits and tradeoffs

- ▶ Pro:
 - ▶ Decouple view from model
 - ▶ Support multiple views [collaborative views]
 - ▶ Maintainability [add new views]
 - ▶ Split teams [relieve critical path]
 - ▶ Testability [reduce UI testing]
- ▶ Con:
 - ▶ Complexity [indirection, events]
 - ▶ Efficiency [frequent updates, large models]

MVP Motivation

- ▶ Take MVC a tiny bit further:
 - ▶ Enhance testability
 - ▶ Further separate Designers from Developers
- ▶ Leveraged by both GWT and .NET

Model

- ▶ Contains application data
 - ▶ This is often persisted to a backing store
- ▶ Does not know how to present itself
- ▶ Is domain independent
- ▶ Often fires events to an Event Bus

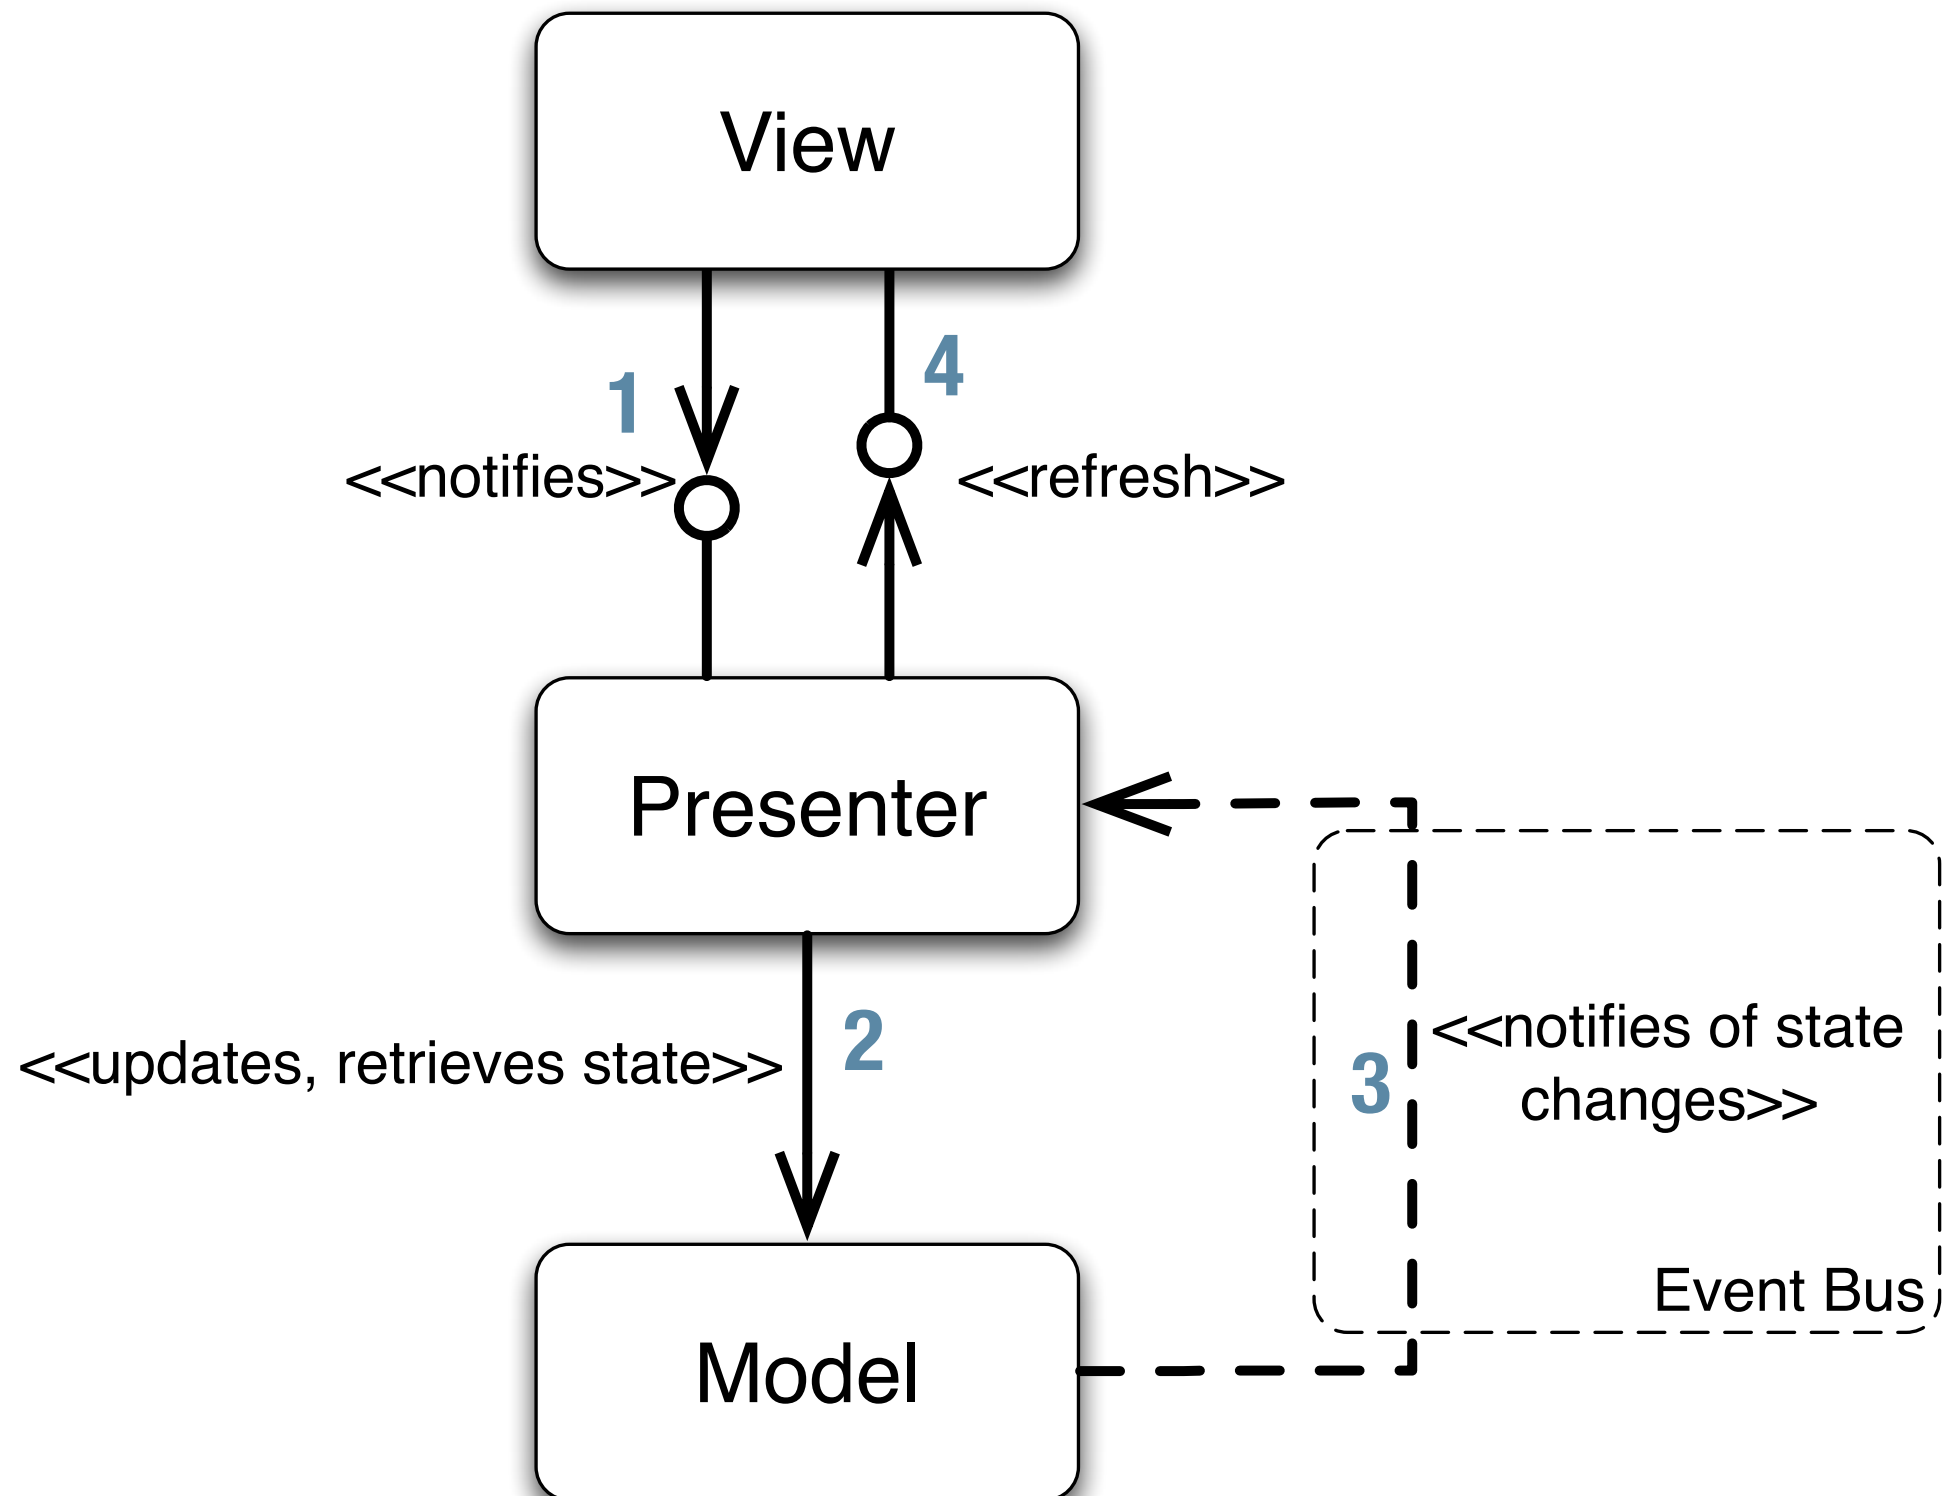

View

- ▶ Thin UI front-end for controller
- ▶ Does not store data
- ▶ Can be interchanged easily
- ▶ Does not ever see or manipulate Model objects
- ▶ Only interacts with primitives
 - ▶ e.g., (setUser(String) instead of setUser(User))

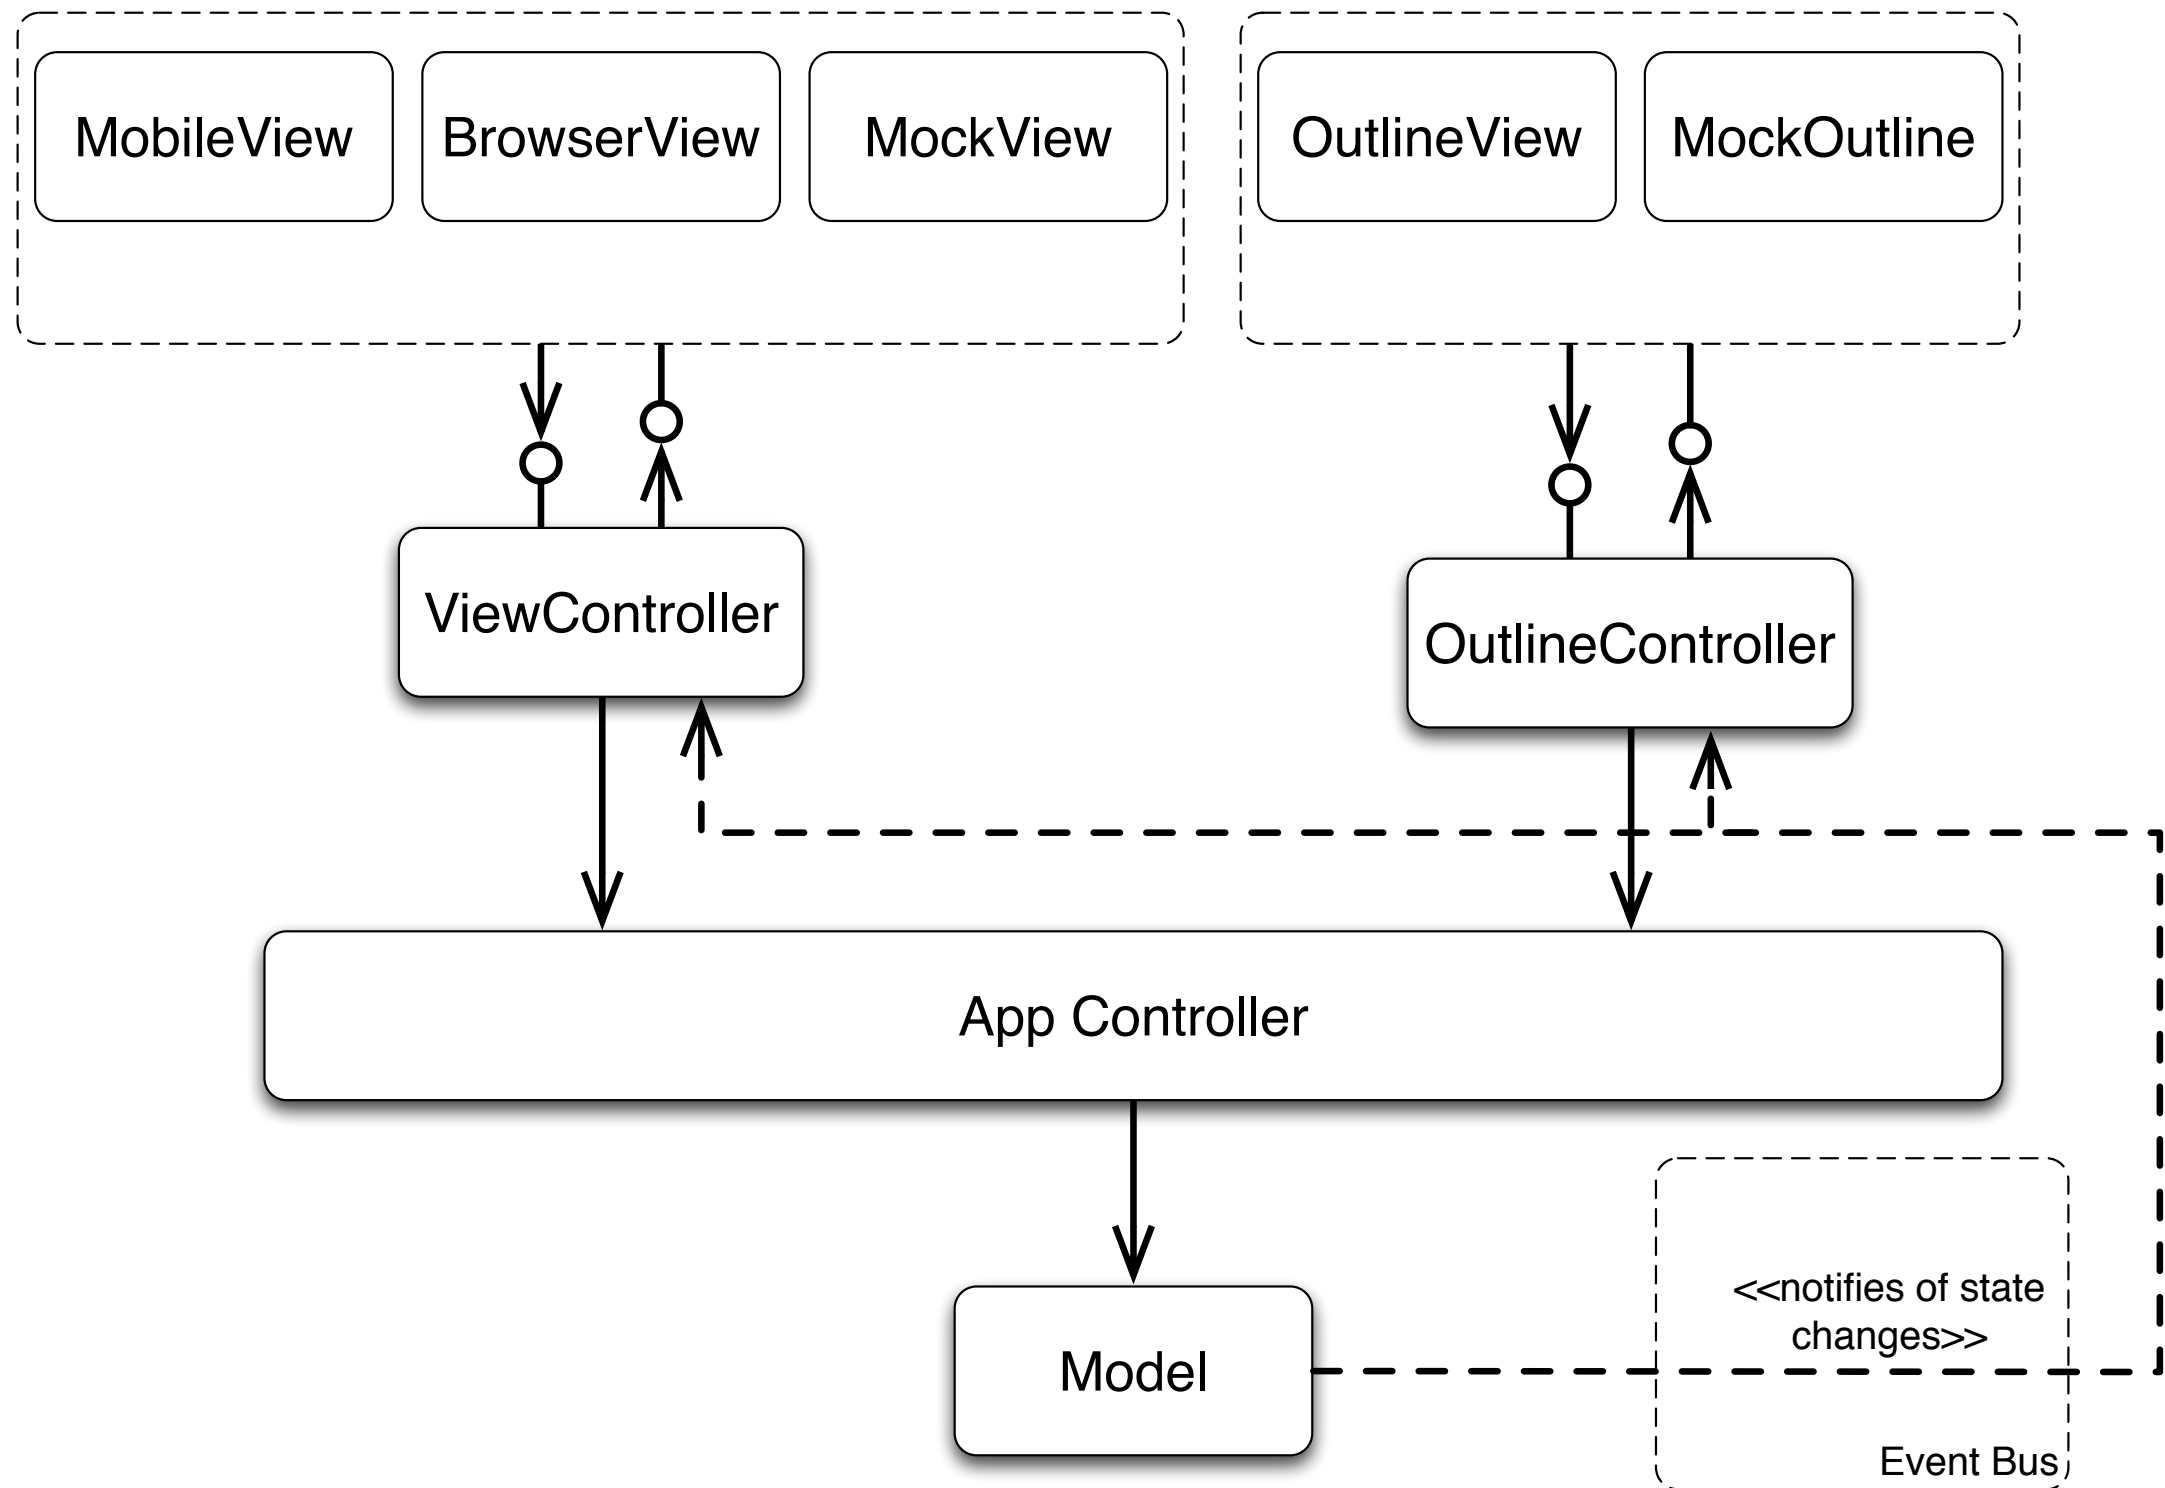

Controller

- ▶ Glues Model and View together
- ▶ Updates the view when the Model changes
- ▶ Updates the model when the user manipulates the view
- ▶ Houses the application logic

MVP Topology

Concrete MVP Topology

Concrete Example

```
Factory f = GWT.create(Factory.class);
AppController ac = new AppController(f);
ac.showMain();
```

-->

```
View v = f.createView(new ViewController());
Outline o = f.createOutline(new OutlineController());
```

[gwt.xml maps Factory.class
to the right type]

```
public interface IJoinTripView {

    Widget asWidget();

    public void setPresenter(Presenter presenter);

    public interface Presenter {
        void onCancel();

        void onJoin(String string);
    }
}
```

Benefits and tradeoffs

- ▶ Same as MVC with improved:
 - ▶ Decoupling of views from the model
 - ▶ Split teams [relieve critical path]
 - ▶ Testability [reduce UI testing]
 - ▶ A little less complex than MVC [fewer events]

Dependency Injection

- ▶ Common problem: ‘how can we wire these interfaces together without creating a dependency on their concrete implementations?’
- ▶ This often challenges the ‘program to interfaces, not implementations ’ design principle
 - ▶ Would like to reduce (eliminate) coupling between concrete classes
- ▶ Would like to be able to substitute different implementations without recompiling
 - ▶ e.g., be able to test and deploy the same binary even though some objects may vary
- ▶ Solution: separate objects from their assemblers

Goal

- ▶ Eliminate initialization statements. e.g.,
 - ▶ `Foo f = new ConcreteFoo();`
- ▶ In dependency injection a third party (an injector)
- ▶ At a high level dependency injection:
 - ▶ **Takes** a set of components (classes + interfaces)
 - ▶ **Adds** a set of configuration metadata
 - ▶ **Provides** the metadata to an injection framework
 - ▶ **Bootstraps** object creation with a configured injector
