Lecture 14c: June 15, 2018

Trust Region Methods

[Nocedal and Wright, Chapter 4]

Optimization in ML

- It is common to formulate ML problems as optimization problems.
 - Min squared error
 - Min cross entropy
 - Max log likelihood
 - Max discounted sum of rewards

Two important classes

- **Line search** methods
 - Find a direction of improvement
 - Select a step length
- **Trust region** methods
 - Select a trust region (analog to max step length)
 - Find a point of improvement in the region

Trust Region Methods

- Idea:
 - Approximate objective f with a simpler objective \tilde{f}
 - Solve $\tilde{x}^* = \operatorname{argmin}_x \tilde{f}(x)$
- **Problem:** The optimum \tilde{x}^* might be in a region where \tilde{f} poorly approximates f and therefore \tilde{x}^* might be far from optimal
- **Solution:** restrict the search to a region where we trust \tilde{f} to approximate f well.
 - Solve $\tilde{x}^* = \operatorname{argmin}_{x \in \text{trustRegion}} \tilde{f}(x)$

Example

- \tilde{f} often chosen to be a quadratic approximation of f

$$\begin{aligned} f(x) &\approx \tilde{f}(x) \\ &= f(c) + \nabla f(c)^T (x - c) + \frac{1}{2!} (x - c)^T H(c)(x - c) \end{aligned}$$

where ∇f is the gradient and H is the hessian

- Trust region often chosen to be a hypersphere
$$\|x - c\|_2 \leq \delta$$

Generic Algorithm

trustRegionMethod

Initialize δ , x_0^* and $n = 0$

Repeat

$n \leftarrow n + 1$

Solve $x_n^* = \operatorname{argmin}_x \tilde{f}(x)$ subject to $\|x - x_{n-1}^*\|_2 \leq \delta$

If $\tilde{f}(x_n^*) \approx f(x_n^*)$ then increase δ
else decrease δ

Until convergence

Trust Region Subproblem

- \tilde{f} often chosen to be a quadratic approximation of f
$$\min_x f(c) + \nabla f(c)^T (x - c) + \frac{1}{2!} (x - c)^T H(c)(x - c)$$
subject to $\|x - c\|_2 \leq \delta$
- When H is positive semi-definite
 - Convex optimization
 - Simple and globally optimal solution
- When H is not positive semi-definite
 - Non-convex optimization
 - Simple heuristics that guarantee improvement
