

# Predicate Logic: Peano Arithmetic

Alice Gao

Lecture 20

# Outline

The Learning Goals

Properties of Equality

Using Logic to Model Number Theory

Revisiting the Learning Goals

# Learning goals

By the end of this lecture, you should be able to:

- ▶ Write a formal deduction proof using rules for equality.
- ▶ Write a formal deduction proof for properties of natural numbers using formal deduction rules and Peano axioms.

# Formal Deduction Rules for Equality

$(\approx -)$  If  $\Sigma \vdash A(t_1)$  and  $\Sigma \vdash t_1 \approx t_2$  then  
 $\Sigma \vdash A'(t_2)$  ←  
where  $A'(t_2)$  results from  $A(t_1)$   
by replacing some (not necessarily all) occurrences  
of  $t_1$  by  $t_2$ .

$(\approx +)$   $\emptyset \vdash u \approx u.$

# Proving Properties of Equality

(Reflexivity)  $\forall x (x = x)$

(Symmetry)  $\forall x \forall y ((x = y) \rightarrow (y = x))$

(Transitivity)  $\forall x \forall y \forall z ((x = y) \wedge (y = z) \rightarrow (x = z))$

# Proving Reflexivity

Reflexivity:  $\emptyset \vdash \forall x (x \approx x)$

$$(1) \quad \emptyset \vdash u \approx u \quad (\approx +)$$

$$(2) \quad \emptyset \vdash \forall x (x \approx x) \quad (\forall +, 1)$$

# Proving Symmetry

Symmetry:  $\emptyset \vdash \forall x \forall y (x \approx y) \rightarrow (y \approx x)$

(1)  $\emptyset \vdash U \approx U \quad (\approx +)$

(2)  $U \approx V \vdash U \approx U \quad (+, 1)$

(3)  $U \approx V \vdash U \approx V \quad (\epsilon)$

$A(x) = x \approx U$

(4)  $U \approx V \vdash V \approx U \quad (\approx -, 2, 3, t_1 = U, t_2 = V, \quad )$

(5)  $\emptyset \vdash (U \approx V) \rightarrow (V \approx U) \quad (\rightarrow +, 4)$

(6)  $\emptyset \vdash \forall y (U \approx y) \rightarrow (y \approx U) \quad (\forall +, 5)$

(7)  $\emptyset \vdash \forall x \forall y (x \approx y) \rightarrow (y \approx x) \quad (\forall +, 6)$

# Proving Transitivity

$$\begin{aligned}
 u &\approx u \\
 u &\approx v \\
 u &\approx v \\
 v &\approx w
 \end{aligned}$$

$$u \approx w$$

$$A(t_1) \rightarrow u \approx v \leftarrow t_1$$

$$A(x) = u \approx x \quad v \approx w \quad t_1 \approx t_2$$

$$A(t_2) \rightarrow u \approx w \leftarrow t_2$$

Transitivity:  $\emptyset \vdash \forall x \forall y \forall z (x \approx y) \wedge (y \approx z) \rightarrow (x \approx z)$

- 1  $(u \approx v) \wedge (v \approx w) \vdash (u \approx v) \wedge (v \approx w) \quad (\in)$
- 2  $(u \approx v) \wedge (v \approx w) \vdash u \approx v \quad (\wedge-, 1)$
- 3  $(u \approx v) \wedge (v \approx w) \vdash v \approx w \quad (\wedge-, 1)$
- 4  $(u \approx v) \wedge (v \approx w) \vdash (u \approx w) \quad (\approx-, 2, 3, t_1=v, t_2=w, A(x)=u \approx x)$
- 5  $\emptyset \vdash (u \approx v) \wedge (v \approx w) \rightarrow (u \approx w) \quad (\rightarrow+, 4)$
- 6  $\emptyset \vdash \forall x \forall y \forall z (x \approx y) \wedge (y \approx z) \rightarrow (x \approx z) \quad (\forall+, \forall+, \forall+, 5)$

# Outline

The Learning Goals

Properties of Equality

Using Logic to Model Number Theory

Revisiting the Learning Goals

# Using Logic to Model Mathematics

We want to use predicate logic to model mathematics.

- ▶ Number theory, with  $0$ ,  $+$ , and  $\cdot$
- ▶ Set theory, with  $\in$  and  $\emptyset$
- ▶ Group theory
- ▶ Graph theory
- ▶ Geometry

For each domain,

- ▶ Define axioms that describe the functions, predicates/relations and individuals/constants.
- ▶ Prove theorems in that domain using predicate logic.

# Number Theory

We would like to formalize the properties of natural numbers.

- ▶ The domain is the set of natural numbers,  $0, 1, 2, 3, \dots$ .
- ▶ Functions: addition  $+$  and multiplication  $\cdot$ .
- ▶ Relations: ordering  $<$ .

The axioms should be a small set of true statements from which we can derive theorems about natural numbers.

# Symbols for Number Theory

- ▶ Individual/Constant:  $0$
- ▶ Functions:
  - addition  $+$
  - multiplication  $\cdot$
  - successor  $s(x)$

$0, 1, 2, 3, 4, \dots$   
 $\uparrow \quad \uparrow \quad \uparrow \quad \nwarrow$   
 $0, s(0), s(s(0)), s(s(s(0)))$

# Peano Axioms (1/2)

## Axioms for successor

PA1 Zero is not a successor of any natural number.

$\forall x \neg (S(x) \approx 0)$  If the successors of two

PA2 If two numbers are the same,

numbers are the same, then

they must have the same predecessor. the two numbers are

$\forall x \forall y (S(x) \approx S(y) \rightarrow x \approx y)$  the same.

## Axioms for addition

PA3 Adding zero to any number yields the same number.

$\forall x (x + 0 \approx x)$

PA4 Adding the successor of a number yields the successor of adding the number.

$\forall x \forall y (x + S(y) \approx S(x + y))$

## Peano Axioms (2/2)

Axioms for multiplication

PA5 Multiplying a number by zero yields zero.

$$\forall x (x \cdot 0 \approx 0)$$

PA6 Multiplying one number and the successor of another number equals the product of the two numbers plus the first number.

$$\forall x \forall y (x \cdot S(y) \approx x \cdot y + x)$$

# Axiom for Induction

For  $n \in \mathbb{N}$ , let  $P(n)$  denote that  $n$  has the property  $P$ .

► (Base Case)

Prove that  $P(0)$  is true.

► (Inductive Step)

Assume that  $P(k)$  is true for some  $k \in \mathbb{N}$ .

Prove that  $P(k+1)$  is true.

By the principle of mathematical induction,  $P(n)$  is true for every  $n \in \mathbb{N}$ .

Expressing this in predicate logic:

$$\underbrace{(P(0))}_{\text{Base Case}} \wedge \underbrace{\forall x (P(x) \rightarrow P(s(x)))}_{\text{Induction step}} \rightarrow \underbrace{\forall x P(x)}_{\text{Conclusion}}$$

*Note: Handwritten red annotations include an arrow from  $x$  to  $k$  above the induction step, and a bracket under  $s(k)$  in the original image.*

## Axiom for Induction

$$(1) \ \emptyset \vdash A(0) \quad \dots\dots$$

$$(2) \ \emptyset \vdash \forall x (A(x) \rightarrow A(s(x))) \quad \dots\dots$$

$$(3) \ \emptyset \vdash A(0) \wedge \forall x (A(x) \rightarrow A(s(x))) \quad (\wedge+, 1, 2)$$

Axiom for induction

PA7 For each predicate formula  $A(x)$  with free variable  $x$

$$(4) \ \emptyset \vdash \underline{[A(0) \wedge \forall x (A(x) \rightarrow A(s(x)))]} \rightarrow \forall x A(x) \quad (\text{PA 7})$$

$$(5) \ \emptyset \vdash \forall x A(x) \quad (\rightarrow-, 3, 4)$$

Prove that  $\forall x (\neg (S(x) \approx x))$

$$\text{PA7 } [A(0) \wedge \forall x (A(x) \rightarrow A(S(x)))] \rightarrow \forall x A(x)$$

$$\phi \vdash \neg (S(0) \approx 0) \quad \star$$

$$\phi \vdash \forall x (\neg (S(x) \approx x) \rightarrow \neg (S(S(x)) \approx S(x))) \quad \star$$

$$\phi \vdash \neg (S(0) \approx 0) \wedge \forall x (\neg (S(x) \approx x) \rightarrow \neg (S(S(x)) \approx S(x))) \quad (\wedge+, \rightarrow)$$

$$\phi \vdash [\neg (S(0) \approx 0) \wedge \forall x (\neg (S(x) \approx x) \rightarrow \neg (S(S(x)) \approx S(x)))] \\ \rightarrow \forall x (\neg (S(x) \approx x)) \quad (\text{PA7})$$

$$\phi \vdash \forall x (\neg (S(x) \approx x)) \quad (\rightarrow-)$$

# Example 1: Every number is not equal to its successor

Every natural number is not equal to its successor.

Prove that  $\forall x (\neg(s(x) = x))$ . PA1  ~~$\forall x$~~  ( $\neg(s(x) \approx 0)$ )

- ▶ Base Case: Prove that  $\neg(s(0) = 0)$  ①

$\Downarrow$   
0

Which Peano Axiom can we use to prove this?

- ▶ Induction Step:

Consider some  $k \in \mathbb{N}$ .

Assume that  $\neg(s(k) = k)$ .

Prove that  $\neg(s(s(k)) = s(k))$ .

Which Peano Axiom can we use to prove this?

$$\neg(s(k) \approx k) \rightarrow \neg(s(s(k)) \approx s(k)) \quad \textcircled{2}$$

$$s(s(k)) \approx s(k) \rightarrow s(k) \approx k$$

$$\forall x \forall y \quad s(x) \approx s(y) \rightarrow x \approx y$$

(1)  $\emptyset \vdash \forall x (\neg (S(x) \approx 0))$  PA1

(2)  $\emptyset \vdash \neg (S(0) \approx 0)$  ( $\forall$ -, 1)

## Example 1: Every number is not equal to its successor

Every natural number is not equal to its successor.

Prove that  $\forall x (\neg(s(x) = x))$ .

1.  $\emptyset \vdash \forall x (s(x) \neq 0)$  (PA1)
2.  $\emptyset \vdash s(0) \neq 0$  ( $\forall$ -, 1)
3.  $s(u) \neq u, s(s(u)) = s(u) \vdash s(s(u)) = s(u)$  ( $\in$ )
4.  $\emptyset \vdash \forall x \forall y (s(x) = s(y) \rightarrow x = y)$  (PA2)
5.  $\emptyset \vdash s(s(u)) = s(u) \rightarrow s(u) = u$  ( $\forall$ -, 4)
6.  $s(u) \neq u, s(s(u)) = s(u) \vdash s(s(u)) = s(u) \rightarrow s(u) = u$  ( $+$ , 5)
7.  $s(u) \neq u, s(s(u)) = s(u) \vdash s(u) = u$  ( $\rightarrow$  -, 6, 3)
8.  $s(u) \neq u, s(s(u)) = s(u) \vdash s(u) \neq u$  ( $\in$ )
9.  $s(u) \neq u \vdash s(s(u)) \neq s(u)$  ( $\neg$ +, 7, 8)
10.  $\emptyset \vdash s(u) \neq u \rightarrow s(s(u)) \neq s(u)$  ( $\rightarrow$  +, 9)
11.  $\emptyset \vdash \forall x (s(x) \neq x \rightarrow s(s(x)) \neq s(x))$  (10,  $\forall$ +, no  $u$  elsewhere)

## Example 1: Every number is not equal to its successor

Every natural number is not equal to its successor.

Prove that  $\forall x(\neg(s(x) = x))$ . (continued)

$$12. \emptyset \vdash s(0) \neq 0 \wedge \forall x(s(x) \neq x \rightarrow s(s(x)) \neq s(x)) \quad (\wedge+, 2, 11)$$

$$13. \emptyset \vdash s(0) \neq 0 \wedge \forall x(s(x) \neq x \rightarrow s(s(x)) \neq s(x)) \\ \rightarrow \forall x(s(x) \neq x) \quad (PA7, \text{ with } A(x) : \text{" } s(x) \neq x \text{"})$$

$$14. \emptyset \vdash \forall x(s(x) \neq x) \quad (\rightarrow -, 12, 13)$$

## Example 2: Every non-zero natural number has a predecessor

Every non-zero natural number has a predecessor.

Prove that  $\forall x(x = 0 \vee \exists y (s(y) = x))$

Base case:

1.  $\emptyset \vdash 0 = 0$  ( $\approx +$ )

2.  $\emptyset \vdash 0 = 0 \vee \exists y(s(y) = 0)$  ( $\vee +, 1$ )

Induction step:

3.  $k = 0 \vdash k = 0$  ( $\in$ )

4.  $\emptyset \vdash s(k) = s(k)$  (prove separately using ( $\approx +$ ))

5.  $k = 0 \vdash s(k) = s(k)$  ( $+, 4$ )

6.  $k = 0 \vdash s(0) = s(k)$  ( $\approx -$ ) with  $A(x) : \text{" } s(x) = s(k) \text{"}$

7.  $k = 0 \vdash \exists y(s(y) = s(k))$  ( $(\exists +), 6$ )

8.  $k = 0 \vdash (s(k) = 0) \vee \exists y(s(y) = s(k))$  ( $\vee +, 8$ )

## Example 2:

Inductive step, second case of  $(\forall-)$

$$9. s(u) = k \vdash s(u) = k \text{ (}\in\text{)}$$

$$10. s(u) = k \vdash k = s(u) \text{ (9, symmetry of =)}$$

$$11. s(u) = k \vdash s(k) = s(k) \text{ (4, +)}$$

$$12. s(u) = k \vdash s(s(u)) = s(k) \text{ (11, 10, }(\approx -), A(x) : s(x) = s(k)\text{)}$$

$$13. s(u) = k \vdash \exists y(s(y) = s(k)) \text{ (12, } \exists+\text{)}$$

$$14. s(u) = k \vdash s(k) = 0 \vee \exists y(s(y) = s(k)) \text{ (13, } \vee+\text{)}$$

$$15. \exists y(s(y) = k) \vdash s(k) = 0 \vee \exists y(s(y) = s(k)) \text{ (14, } \exists-\text{),}$$

no  $u$  elsewhere)

$$16. k = 0 \vee \exists y(s(y) = k) \vdash s(k) = 0 \vee \exists y(s(y) = s(k)) \text{ (8, 15, } \vee-\text{)}$$

$$17. \emptyset \vdash k = 0 \vee \exists y(s(y) = k) \rightarrow s(k) = 0 \vee \exists y(s(y) = s(k)) \text{ (16, } \rightarrow+\text{)}$$

$$18. \emptyset \vdash \forall x(P(x) \rightarrow P(s(x))) \text{ (17, } \forall+\text{, no } k \text{ elsewhere)}$$

$$19. \emptyset \vdash P(0) \wedge \forall x(P(x) \rightarrow P(s(x))) \text{ (18, 2, } \wedge+\text{)}$$

$$20. \emptyset \vdash P(0) \wedge \forall x(P(x) \rightarrow P(s(x))) \rightarrow \forall xP(x) \text{ (PA7)}$$

$$21. \emptyset \vdash \forall x(x = 0 \vee \exists y(s(y) = x)) \text{ (20, 19, } \rightarrow-\text{)}$$

## Revisiting the learning goals

By the end of this lecture, you should be able to:

- ▶ Write a formal deduction proof using rules for equality.
- ▶ Write a formal deduction proof for properties of natural numbers using formal deduction rules and Peano axioms.
