

Sept 21.

Theorem:  $\{\wedge, \vee\}$  is not an adequate set of connectives.

Proof: To prove this theorem, we will prove the following lemma first.

Lemma: For any formula which uses only  $\wedge$  and  $\vee$  as connectives, if every variable in the formula is true, then the formula is true.

See the next page for a proof of this lemma using structural induction. Now we use this lemma below.

It's sufficient to show that we cannot write  $(\neg x)$  using only  $\wedge$  and  $\vee$ .

Assume  $x$  is true. Then  $(\neg x)$  is false.

By the lemma, for any formula using  $x$ ,  $\wedge$ , and  $\vee$ , the formula must be true when  $x$  is true. Therefore, we cannot use  $x$ ,  $\wedge$  and  $\vee$  to write a formula that is false when  $x$  is true.

So we cannot write  $(\neg x)$  using only  $\wedge$  and  $\vee$ .

$\{\wedge, \vee\}$  is not an adequate set of connectives.

QED.

$\{\wedge, \vee\}$  is not an adequate set of connectives. Sept 21

Lemma: For any formula which uses only  $\wedge$  and  $\vee$  as connectives, if every variable in the formula is true, then the formula is true.

Let  $P(\varphi)$  denote  $\varphi$  is true when every variable in  $\varphi$  is true where  $\varphi$  uses only  $\wedge$  and  $\vee$  as connectives.

Proof by structural induction on  $\varphi$ .

Base case:  $\varphi$  is a propositional variable  $p$ .

If  $p$  is true, then  $\varphi$  is true.  $P(\varphi)$  holds.

Induction step:

case 1:  $\varphi = (x \wedge y)$  where  $x$  and  $y$  use only  $\wedge$  and  $\vee$  as connectives.

Induction Hypothesis: if every variable in  $x$  (and  $y$ ) is true, then  $x$  (and  $y$ ) is true.

Assume every variable in  $\varphi$  is true. Then every variable in  $x$  and  $y$  is true. By induction hypothesis,  $x$  and  $y$  are true. So  $\varphi = (T \wedge T) \equiv T$ .

case 2:  $\varphi = (x \vee y)$  where  $x$  and  $y$  use only  $\wedge$  and  $\vee$  as connectives.

Induction Hypothesis: if every variable in  $x$  (and  $y$ ) is true, then  $x$  (and  $y$ ) is true.

Assume every variable in  $\varphi$  is true. Then every variable in  $x$  and  $y$  is true. By induction hypothesis,  $x$  and  $y$  are true. So  $\varphi = (T \vee T) \equiv T$ .

By the principle of structural induction,  $P(\varphi)$  holds for every  $\varphi$  that uses only  $\wedge$  and  $\vee$  as connectives. QED
