Physical Data Independence

Knowledge Representation: a Big Picture

What is "Knowledge" (how is it represented, and does the user care?) \Rightarrow not really as long as the updates and queries "play nicely together"

Knowledge Representation: a Big Picture

What is "Knowledge" (how is it represented, and does the user care?) \Rightarrow not really as long as the updates and queries "play nicely together"

Structured World:

- *K* is a (first order) theory,
- queries are (FO) formulæ with answers defined by entailment, and
- updates are (variations on) belief revision.

Knowledge Representation: a Big Picture

What is "Knowledge" (how is it represented, and does the user care?) \Rightarrow not really as long as the updates and queries "play nicely together"

Probabilistic World:

- K is a ML model (e.g., neural net),
- queries are inputs (e.g., photos) and answers are labels
- updates are pairs of, e.g., photos with their labels.

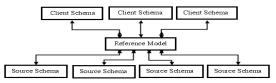

Ontology-based Data Access (OBDA) [Calvanese et al.: Mastro, 2011]

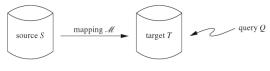

Fig. 1. Ontology-based data access.

Information Integration [Genesereth: Data Integration, 2010]

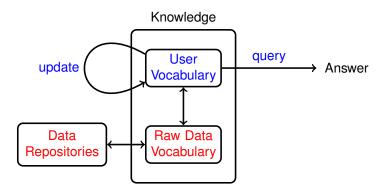

Data Exchange [Arenas et el.: Data Exchange, 2014]

The general setting of data exchange is this:

Data vs. Metadata

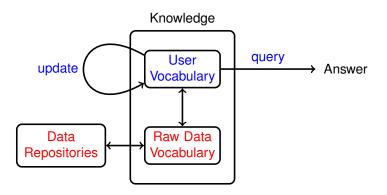

Metadata: constraints formulated in FOL (static)
 Data: ground tuples (can be "modified")
 user queries and updates only about data.

Motivation

イロト イヨト イヨト イヨト

Data vs. Metadata

Metadata: constraints formulated in FOL (static)

- 2 Data: ground tuples (can be "modified")
 - \Rightarrow user queries and updates only about data.

(Physical) Data Independence

IDEA:

Separate the users' view(s) of the data from the way it is physically represented.

Originally just two levels: physical and conceptual/logical [Codd1970]

Physical Data Independence and ADTs

- data independence [Bachman, 1969 Date and Hopewell, 1971] and [Codd, 1970]
- ADTs [Liskov and Zilles, 1974]

ANSI-SPARC Architecture for Databases Users external level (View) multiple user's views Community view of DB conceptual level (Schema) Physical representation internal level (Schema) Database (Physical level)

(Physical) Data Independence

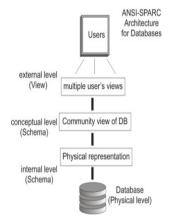

IDEA:

Separate the users' view(s) of the data from the way it is physically represented.

Originally just two levels: physical and conceptual/logical [Codd1970].

 data independence [Bachman, 1969 Date and Hopewell, 1971] and [Codd, 1970]

ADTs [Liskov and Zilles, 1974]

[ANSI/X3/SPARC Standards Planning and Requirements Committee, Bachman, 1975]

(Physical) Data Independence

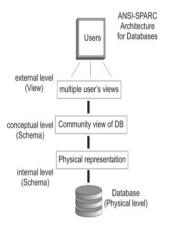

IDEA:

Separate the users' view(s) of the data from the way it is physically represented.

Originally just two levels: physical and conceptual/logical [Codd1970].

Physical Data Independence and ADTs

- data independence [Bachman, 1969, Date and Hopewell, 1971] and [Codd, 1970]
- ADTs [Liskov and Zilles, 1974]

[ANSI/X3/SPARC Standards Planning and Requirements Committee, Bachman, 1975]

- 4 Future Research/Open Issues

QUERIES AND QUERY COMPILATION

The Structured/Logical Way (via an OBDA example)

Queries and Ontologies

Queries are answered not only w.r.t. *explicit data* (A) but also w.r.t. *background knowledge* (T)

 \Rightarrow Ontology-based Data Access (OBDA)

Example

- Socrates is a MAN
- Every MAN is MORTAL
- *List all MORTALs* \Rightarrow {Socrates}

(explicit data) (ontology) (query)

Using logical implication (to define certain answers):

 $\mathsf{Ans}(\varphi, \mathcal{A}, \mathcal{T}) := \{\varphi(a_1, \dots, a_k) \mid \mathcal{T} \cup \mathcal{A} \models \varphi(a_1, \dots, a_k)\}$

 \Rightarrow answers are ground φ -atoms logically implied by $\mathcal{A} \cup \mathcal{T}$.

イロト イポト イヨト イヨト

The Structured/Logical Way (via an OBDA example)

Queries and Ontologies

Queries are answered not only w.r.t. *explicit data* (A) but also w.r.t. *background knowledge* (T)

 \Rightarrow Ontology-based Data Access (OBDA)

Example

- Socrates is a MAN
- Every MAN is MORTAL

List all MORTALs \Rightarrow {Socrates}

How do we answer queries?

Using logical implication (to define certain answers):

$$\mathsf{Ans}(\varphi, \mathcal{A}, \mathcal{T}) := \{\varphi(a_1, \dots, a_k) \mid \mathcal{T} \cup \mathcal{A} \models \varphi(a_1, \dots, a_k)\}$$

 \Rightarrow answers are *ground* φ *-atoms* logically implied by $\mathcal{A} \cup \mathcal{T}$.

(explicit data) (ontology) (query)

The Logical Way: Complexity

The Good News

LOGSPACE/PTIME (data complexity) for query answering:

- (U)CQ and
- DL-Lite $/\mathcal{EL}_{\perp}/\mathcal{CFD}_{nc}^{\forall}$ ("rules"-lite (Horn), s-t dependencies,...

The Bad News

- no negative queries/sub-queries
- no negations in ABox
- no closed-world assumption
- counter-intuitive query answers

 \Rightarrow the same goes for information integration, data exchange, etc.

イロト イポト イヨト イヨト

Example

- EMP(Sue)
- *EMP* \sqsubseteq \exists *PHONENUM* (or $\forall x. EMP(x) \rightarrow \exists y. PHONENUM(x, y)$)

(D) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

æ

Example

- EMP(Sue)
- *EMP* \sqsubseteq \exists *PHONENUM* (or $\forall x.EMP(x) \rightarrow \exists y.PHONENUM(x, y)$)

User: *Does Sue have a phone number?* Information System: *YES*

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Example

- EMP(Sue)
- *EMP* \sqsubseteq \exists *PHONENUM* (or $\forall x. EMP(x) \rightarrow \exists y. PHONENUM(x, y)$)

User: Does Sue have a phone number? Information System: YES User: OK, tell me Sue's phone number! Information System: (no answer)

イロト イポト イヨト イヨト

Example

- EMP(Sue)
- *EMP* \sqsubseteq \exists *PHONENUM* (or $\forall x.EMP(x) \rightarrow \exists y.PHONENUM(x, y)$)

User: Does Sue have a phone number?

- Information System: YES
 - User: OK, tell me Sue's phone number!

Information System: (no answer)

User:

What does a User Want? ... but is afraid to ask

- what I know and what I don't is just a single model (CWA);
- 2 queries are model-checked against this model;
- **3** updates change the model into another single model.

What does a User Want? ... but is afraid to ask

- what I know and what I don't is just a single model (CWA);
- 2 queries are model-checked against this model;
- **3** updates change the model into another single model.

YES, BUT:

- it better run fast!! (and preferably without having to code algorithms/data structures by hand)
- and performance/data storage-representation/...can all be improved/changed without changing the user queries/updates

User Queries and Updates – for TODAY

Queries: First-order (open) formulae over the user vocabulary \Rightarrow only *range-restricted* formulae

Updates: Instances of *Delta-relations* (tuples to be inserted/deleted) for ALL relations in the user vocabulary ⇒ only *consistency-preserving transactions* allowed

... a.k.a. the Relational Model and Relational Calculus [Codd, 1972].

Rewritability and Definability

User and System Expectations

Queries	range-restricted FOL (a.k.a. SQL)	
Data	CWA (complete information)	

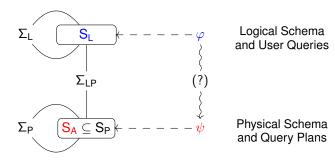

Rewritability and Definability

User and System Expectations

Queriesrange-restricted FOL over SL definable w.r.t. Σ and SAOntology/Schemarange-restricted FOL $\Sigma := \Sigma_L \cup \Sigma_{LP} \cup \Sigma_P$ DataCWA (complete information for SA symbols)

[Borgida, de Bruijn, Franconi, Seylan, Straccia, Toman, Weddell: On Finding Query Rewritings under Expressive Constraints. SEBD 2010: 426-437]

13/41

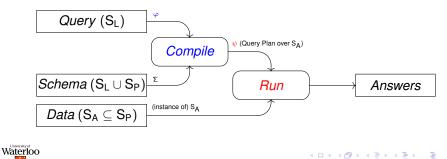

Rewritability and Definability

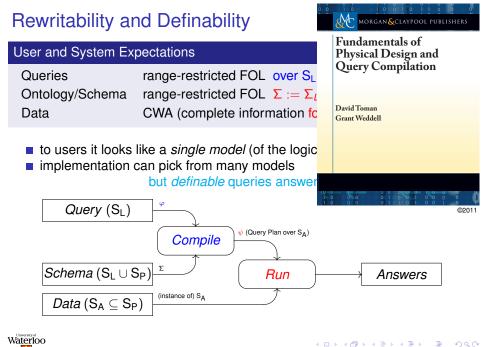

User and System Expectations

Queries	range-restricted FOL over S_L definable w.r.t. Σ and S_A
Ontology/Schema	range-restricted FOL $\Sigma := \Sigma_L \cup \Sigma_{LP} \cup \Sigma_P$
Data	CWA (complete information for S _A symbols)

- to users it looks like a single model (of the logical schema)
- implementation can pick from many models

but definable queries answer the same in each of them

This is NOT OMQ/OBDA (by example)

$$\mathsf{S}_{\mathsf{L}} = \{ \texttt{emp}/1, \texttt{wkr}/1, \texttt{mgr}/1 \} \text{ and } \mathsf{\Sigma}_{\mathsf{L}} = \left\{ \begin{array}{c} \texttt{mgr}(x) \lor \texttt{wkr}(x) \leftrightarrow \texttt{emp}(x) \\ \texttt{mgr}(x) \land \texttt{wkr}(x) \rightarrow \bot \end{array} \right\}$$

$$S_A = \{\texttt{emp}/1/0,\texttt{mgr}/1/0\}$$

э

A B F A B F

This is NOT OMQ/OBDA (by example)

$$\mathsf{S}_\mathsf{L} = \{\texttt{emp}/1, \texttt{wkr}/1, \texttt{mgr}/1\} \text{ and } \mathsf{\Sigma}_\mathsf{L} = \left\{ \begin{array}{c} \texttt{mgr}(x) \lor \texttt{wkr}(x) \leftrightarrow \texttt{emp}(x) \\ \texttt{mgr}(x) \land \texttt{wkr}(x) \rightarrow \bot \end{array} \right\}$$

$$S_A = \{\texttt{emp}/1/0, \texttt{mgr}/1/0\}$$

Query $\{x \mid wkr(x)\}$ over mgr = {Fred}, and emp = {Fred, Wilma}

Certain Answer under OWA: { } Answer under CWA: {Wilma} (obtained by executing the plan {x | emp(x) \land \negmgr(x)}).

What can we do with this?

Generate query plans that compete with hand-written programs in C

- 1 standard RDBMS physical designs (and more),
 - access to search structures (index access and selection),
 - horizontal partitioning/sharding,
 - column store/index-only plans,
- 2 pointer-based data structures (including main mamory),
- a hash-based access to data (including hash-joins),
- 4 multi-level storage (aka disk/remote/distributed files), ...
- 5 materialized views,
- 6 updates through logical schema
 - ... all without having to code (too much) in C/C++ !

7 . . .

イロト イヨト イヨト イヨト

Standard Physical Designs

- scanning (flat) files
- 2 primary and secondary indices (via record ids/addresses)
- 3 horizontal partitioning/sharding
- 4 column store/index-only plans
- 6 (disjoint) generalizations

 worksin INTEGER NOT NULL
                                  manager INTEGER NOT NULL,
                                  PRIMARY KEY (num),
 PRIMARY KEY (num),
 FOREIGN KEY (worksin)
                                  FOREIGN KEY (manager)
        REFERENCES department
                                        REFERENCES employee
```

this corresponds to

- \blacksquare $S_L = \{\texttt{employee}/3, \texttt{department}/3\}$ and
- $\Sigma_L = \{ \text{employee}(x, y_1, z_1) \land \text{employee}(x, y_2, z_2) \rightarrow y_1 = y_2 \land z_1 = z_2, \\ \text{employee}(x, y, z) \rightarrow \exists u, v. \text{department}(z, u, v), \dots \text{and many more} \}.$

additional logical constraints (for example):

- managers are employees that manage a department (a view)
- managers work in their own departnemts (business rule)
- workers and managers partition employees (partition), etc.

3

Pointers in Main Memory-Physical Design

1 Records:

<pre>struct emp {</pre>		
int	num;	
char[20]	name;	
dept*	dept;	};

<pre>struct dept {</pre>		
int	num;	
char[50]	name;	
mgr*	emp;	};

2 a linked list of emp records.

that corresponds to

- Access paths (S_A):
 - empfile/1/0: set (list) of addresses of emp records;

dept-num/2/1: pairs dept record address-dept number

same for dept-name/2/1 and dept-mgr/2/1.

Integrity constraints ($\Sigma_P \cup \Sigma_{LP}$):

 $\begin{array}{l} \forall x, y, z. \texttt{employee}(x, y, z) \rightarrow \exists w. \texttt{empfile}(w) \land \texttt{emp-num}(w, x), \\ \forall a, x. \texttt{empfile}(a) \land \texttt{emp-num}(a, x) \rightarrow \exists y, z. \texttt{employee}(x, y, z), \ldots \end{array}$

Waterloo

Query Plans that Navigate Pointers

Updates

Katsuno, Mendelzon: On the Difference between Updating a Knowledge Base and Revising It. KR 1991.

2 De Giacomo, Lenzerini, Poggi, Rosati: On Instance-level Update and Erasure in Description Logic Ontologies. J. Log. Comput. 19(5) 2009.

... we follow a *definable updates* approach here instead...

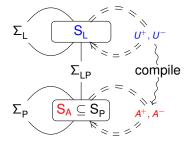

Updates and Definability

User updates through logical schema ONLY:

 \Rightarrow supplying "delta" relations (sets of tuples)

Delta relations: R^+ (insertions) and R^- (deletions);

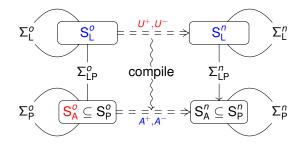

26/41

Updates and Definability

User updates through logical schema ONLY:

 \Rightarrow supplying "delta" relations (sets of tuples)

Delta relations: R⁺ (insertions) and R⁻ (deletions);

Update turned into definability question

Is A^n (or A^+, A^-) definable in terms of $A^o_i \in S^o_A$ (old access paths) and U^+_i , U^-_i (user updates) for every access path $A \in S_A$?

Unknown/Anonymous Values?

Example (Add a new Undergraduate student)

INSERT into undergrad values (1234, 'Wilma');

 \Rightarrow the request then needs to be translated to

INSERT into student values (0xFE1234, 1234, 'Wilma'); ⇒ but where did 0xFE1234 came from? (definability issue!)

イロト イポト イヨト イヨト

Unknown/Anonymous Values?

Example (Add a new Undergraduate student)

INSERT into undergrad values (1234, 'Wilma');

 \Rightarrow the request then needs to be translated to

INSERT into student values (0xFE1234, 1234, 'Wilma'); ⇒ but where did 0xFE1234 came from? (definability issue!)

Constant Complement: [Bancilhon, Spyratos: Update semantics of relational views. ACM Trans. Database Syst. 6(4), 1981.]

additional access paths that provide such values:

- \Rightarrow in our case student-addr (id, adress)
- \Rightarrow and where undergrad⁺ = {(1234, *Vilma*)}

 $\texttt{student}^+(x_1, x_2, x_3) = \texttt{undergrad}^+(x_1, x_3) \land \texttt{student} - \texttt{addr}(x_2, x_1)$

イロン イボン イヨン 一日

Unknown/Anonymous Values?

Example (Add a new Undergraduate student)

INSERT into undergrad values (1234, 'Wilma');

 \Rightarrow the request then needs to be translated to

INSERT into student values (0xFE1234, 1234, 'Wilma'); ⇒ but where did 0xFE1234 came from? (definability issue!)

Constant Complement: [Bancilhon, Spyratos: Update semantics of relational views. ACM Trans. Database Syst. 6(4), 1981.]

additional access paths that provide such values:

- \Rightarrow in our case student-addr (id, adress)
- \Rightarrow and where undergrad⁺ = {(1234, *Vilma*)}

 $\texttt{student}^+(x_1, x_2, x_3) = \texttt{undergrad}^+(x_1, x_3) \land \texttt{student} - \texttt{addr}(x_2, x_1)$

The additional access path(s) correspond to *space allocation* ... and cyclic dependencies are broken via *reification*.

Query Plans via Interpolation

IDEA #1: Plans as Formulas

Represent query plans as (annotated) range-restricted formulas ψ over S_A:

atomic formula	\mapsto	access path (get-first-get-next iterator)
conjunction	\mapsto	nested loops join
existential quantifier	\mapsto	projection (annotated w/duplicate info)
disjunction	\mapsto	concatenation
negation	\mapsto	simple complement

 \Rightarrow reduces correctness of ψ to logical implication $\Sigma \models \varphi \leftrightarrow \psi$

Query Plans via Interpolation

IDEA #1: Plans as Formulas

Represent query plans as (annotated) range-restricted formulas ψ over S_A:

atomic formula	\mapsto	access path (get-first-get-next iterator)
conjunction	\mapsto	nested loops join
existential quantifier	\mapsto	projection (annotated w/duplicate info)
disjunction	\mapsto	concatenation
negation	\mapsto	simple complement

 \Rightarrow reduces correctness of ψ to logical implication $\Sigma \models \varphi \leftrightarrow \psi$

Non-logical (but necessary) Add-ons

- 1 Non-logical properties/operators
 - binding patterns
 - duplication of data and duplicate-preserving/eliminating projections
 - sortedness of data (with respect to the *iterator semantics*) and sorting
- 2 Cost model

Beth Definability and Craig Interpolation

IDEA #2: What Queries do we allow?

We only allow queries that have *the same answer* in every model of Σ for a fixed interpretation of the signature S_A (i.e., where the actual data is).

Beth Definability and Craig Interpolation

IDEA #2: What Queries do we allow?

We only allow queries that have *the same answer* in every model of Σ for a fixed interpretation of the signature S_A (i.e., where the actual data is).

How do we test for this?

 φ is *Beth definable* [Beth'56] if

 $\Sigma\cup\Sigma'\models\varphi\to\varphi'$

where $\Sigma'(\varphi')$ is $\Sigma(\varphi)$ in which symbols *NOT in* S_A are *primed*, respectively.

イロト イポト イヨト イヨト

Beth Definability and Craig Interpolation

IDEA #2: What Queries do we allow?

We only allow queries that have *the same answer* in every model of Σ for a fixed interpretation of the signature S_A (i.e., where the actual data is).

How do we test for this?

 φ is *Beth definable* [Beth'56] if

 $\Sigma\cup\Sigma'\models\varphi\to\varphi'$

where $\Sigma'(\varphi')$ is $\Sigma(\varphi)$ in which symbols *NOT in* S_A are *primed*, respectively.

How do we find ψ ?

If $\Sigma \cup \Sigma' \models \varphi \rightarrow \varphi'$ then there is ψ s.t. $\Sigma \cup \Sigma' \models \varphi \rightarrow \psi \rightarrow \varphi'$ with $\mathcal{L}(\psi) \subseteq \mathcal{L}(S_A)$ ψ is called the *Craig Interpolant* [Craig'57].

... we extract an *interpolant* ψ from a (TABLEAU) proof of $\Sigma \cup \Sigma' \models \varphi \rightarrow \varphi'$

Issues with TABLEAU

Dealing with the subformula property of Tableau

- \Rightarrow analytic tableau *explores* formulas *structurally*
- ⇒ (to large degree) the structure of interpolant depends on where access paths are present in queries/constraints.

Factoring *logical reasoning* from *plan enumeration*

 \Rightarrow backtracking tableau to get alternative plans: too slow, too few plans

Issues with TABLEAU

Dealing with the subformula property of Tableau

- \Rightarrow analytic tableau *explores* formulas *structurally*
- ⇒ (to large degree) the structure of interpolant depends on where access paths are present in queries/constraints.

IDEA #3:

Separate *general constraints* from *physical rules* in the formulation of the definability question (and the subsequent interpolant extraction):

 $\Sigma^{L} \cup \Sigma^{R} \cup \Sigma^{LR} \models \varphi^{L} \rightarrow \varphi^{R} \text{ where } \Sigma^{LR} = \{ \forall \bar{x}. P^{L} \leftrightarrow P \leftrightarrow P^{R} \mid P \in S_{A} \}$

Factoring logical reasoning from plan enumeration

 \Rightarrow backtracking tableau to get alternative plans: too slow, too few plans

IDEA #4:

Define *conditional tableau* exploration (using general constraints) and separate it from plan generation (using physical rules)

Summary

Take Home

While in theory *interpolation* essentially solves the *query rewriting over FO schemas/views* problem, the devil is (as usual) in the details.

[Borgida, de Bruijn, Franconi, Seylan, Straccia, Toman, Weddell: On Finding Query Rewritings under Expressive Constraints. SEBD 2010: 426-437 ... but an (almost) working system only this year.

- 1 FO tableau based interpolation algorithm
 - \Rightarrow enumeration of plans factored from of tableau reasoning
 - \Rightarrow extra-logical binding patterns and cost model
- 2 Post processing (using CFDInc approximation)
 - \Rightarrow duplicate elimination elimination
 - \Rightarrow cut insertion
- 3 Run time
 - ⇒ library of common data/legacy structures+schema constraints
- \Rightarrow finger data structures to simulate merge joins et al.

David Toman (et al.)

Summary

イロト イポト イヨト イヨト

39/41

Research Directions and Open Issues

- Dealing with ordered data? (merge-joins etc.: we have a partial solution)
- 2 Decidable schema languages (decidable interpolation problem)?
- 3 More powerful schema languages (inductive types, etc.)?
- 4 Beyond FO Queries/Views (e.g., count/sum aggregates)?
- **5** Coding extra-logical bits (e.g., binding patterns, postprocessing, etc.) in the schema itself?
- 6 Standard Designs (a plan can always be found as in SQL)?
- Explanation(s) of non-definability?
- 8 Fine(r)-grained updates?

... and, as always, performance, performance, performance!

Summary

Bachman, C. W. (1969).

CODASYL data base task group: October 1969 report.

Codd, E. F. (1970).

A relational model of data for large shared data banks. *Commun. ACM*, 13(6):377–387.

Codd, E. F. (1972).

Relational completeness of data base sub-languages. In Rustin, R., editor, *Data Base Systems*, pages 33–64. Prentice-Hall.

Date, C. J. and Hopewell, P. (1971).

Storage structure and physical data independence.

In Proceedings of the 1971 ACM SIGFIDET (now SIGMOD) Workshop on Data Description, Access and Control, SIGFIDET '71, pages 139–168. ACM.

Hudek, A. K., Toman, D., and Weddell, G. E. (2015).

On enumerating query plans using analytic tableau.

In Automated Reasoning with Analytic Tableaux and Related Methods - 24th International Conference, TABLEAUX 2015, Wrocław, Poland, September 21-24, 2015. Proceedings, pages 339–354.

Liskov, B. H. and Zilles, S. N. (1974).

Programming with abstract data types.

SIGPLAN Notices, 9(4):50-59.

Toman, D. and Weddell, G. E. (2017).

An interpolation-based compiler and optimizer for relational queries (system design report). In IWIL@LPAR 2017 Workshop and LPAR-21 Short Presentations, Maun, Botswana, May 7-12, 2017.
