

# Multiagent Systems: Intro to Game Theory

CS 486/686: Introduction to Artificial Intelligence

# Introduction

- So far almost everything we have looked at has been in a single-agent setting
  - Today - **Multiagent Decision Making!**
- For participants to act optimally, they must account for how others are going to act
- We want to
  - Understand the ways in which agents **interact** and **behave**
  - **Design** systems so that agents behave the way we would like them to

**Hint for the final exam:** MAS is my main research area. I like MAS problems. I even enjoy marking MAS questions. There **will** be a MAS question on the exam.

# Self-Interest

- We will focus on *self-interested* MAS
- Self-interested does **not** necessarily mean
  - Agents want to harm others
  - Agents only care about things that benefit themselves
- Self-interested means
  - Agents have their own *description* of states of the world
  - Agents take *actions* based on these descriptions

# What is Game Theory?

- The study of **games!**
  - Bluffing in poker
  - What move to make in chess
  - How to play Rock-Paper-Scissors

But also

- auction design
- strategic deterrence
- election laws
- coaching decisions
- routing protocols
- ...

# What is Game Theory?

- Game theory is a formal way to analyze **interactions** among a **group** of **rational** agents that behave **strategically**
  - **Group**: Must have more than 1 decision maker
    - Otherwise, you have a decision problem, not a game

Solitaire is not a game!

# What is Game Theory?

- Game theory is a formal way to analyze **interactions** among a **group** of **rational** agents that behave **strategically**
  - **Interaction:** What one agent does directly affects at least one other
  - **Strategic:** Agents take into account that their actions influence the game
  - **Rational:** Agents chose their best actions

# Example

- Decision Problem
  - Everyone pays their own bill
- Game
  - Before the meal, everyone decides to split the bill evenly

# Strategic Game (Matrix Game, Normal Form Game)

- Set of **agents**:  $I = \{1, 2, \dots, N\}$
- Set of **actions**:  $A_i = \{a_i^1, \dots, a_i^m\}$
- Outcome of a game is defined by a **profile**  $a = (a_1, \dots, a_n)$
- Agents have **preferences** over outcomes
  - Utility functions  $u_i: A \rightarrow \mathbf{R}$

# Examples

		Agent 2	
		One	Two
Agent 1	One	2, -2	-3, 3
	Two	-3, 3	4, -4

$I = \{1, 2\}$

$A_i = \{\text{One}, \text{Two}\}$

$A_n$  outcome is (One, Two)

$U_1((\text{One}, \text{Two})) = -3$  and  $U_2((\text{One}, \text{Two})) = 3$

**Zero-sum game.**  
 $\sum_{i=1}^n u_i(o) = 0$

# Examples

## BoS

	B	S
B	2,1	0,0
S	0,0	1,2

Coordination Game

## Chicken

	T	C
T	-1,-1	10,0
C	0,10	5,5

Anti-Coordination Game

# Example: Prisoners' Dilemma

Confess

Don't Confess

Confess

-5,-5

0,-10

Don't  
Confess

-10,0

-1,-1

# Playing a Game

- Agents are **rational**
  - Let  $p_i$  be agent  $i$ 's belief about what its opponents will do
  - **Best response**:  $a_i = \operatorname{argmax}_{a_i} \sum_{a_{-i}} u_i(a_i, a_{-i}) p_i(a_{-i})$

**Notation Break:  $a_{-i} = (a_1, \dots, a_{i-1}, a_{i+1}, \dots, a_n)$**

# Dominated Strategies

- $a'_i$  **strictly dominates** strategy  $a_i$  if

$$u_i(a'_i, a_{-i}) > u_i(a_i, a_{-i}) \forall a_{-i}$$

- A rational agent will never play a dominated strategy!

# Example

	Confess	Don't Confess
Confess	-5,-5	0,-10
Don't Confess	-10,0	-1,-1

# Strict Dominance Does Not Capture the Whole Picture

	A	B	C
A	0,4	4,0	5,3
B	4,0	0,4	5,3
C	3,5	3,5	6,6

# Nash Equilibrium

**Key Insight:** an agent's best-response depends on the actions of other agents

An action profile  $a^*$  is a **Nash equilibrium** if no agent has incentive to change given that others do not change

$$\forall i u_i(a_i^*, a_{-i}^*) \geq u_i(a_i', a_{-i}^*) \forall a_i'$$

# Nash Equilibrium

- Equivalently,  $a^*$  is a N.E. iff

$$\forall i a_i^* = \arg \max_{a_i} u_i(a_i, a_{-i}^*)$$

	A	B	C
A	0,4	4,0	5,3
B	4,0	0,4	5,3
C	3,5	3,5	6,6

(C,C) is a N.E. because

$$u_1(C, C) = \max \begin{bmatrix} u_1(A, C) \\ u_1(B, C) \\ u_1(C, C) \end{bmatrix}$$

AND

$$u_2(C, C) = \max \begin{bmatrix} u_2(C, A) \\ u_2(C, B) \\ u_2(C, C) \end{bmatrix}$$

# Nash Equilibrium

- If  $(a_1^*, a_2^*)$  is a N.E. then player 1 won't want to change its action given player 2 is playing  $a_2^*$
- If  $(a_1^*, a_2^*)$  is a N.E. then player 2 won't want to change its action given player 1 is playing  $a_1^*$

-5,-5	0,-10
-10,0	-1,-1

	A	B	C
A	0,4	4,0	5,3
B	4,0	0,4	5,3
C	3,5	3,5	6,6

# Another Example

	B	S
B	2,1	0,0
S	0,0	1,2

2 Nash Equilibria

Coordination Game

# Yet Another Example

		Agent 2	
		One	Two
Agent 1	One	2,-2	-3,3
	Two	-3,3	4,-4

# (Mixed) Nash Equilibria

- **(Mixed) Strategy:**  $s_i$  is a probability distribution over  $A_i$
- **Strategy profile:**  $s = (s_1, \dots, s_n)$
- **Expected utility:**  $u_i(s) = \sum_a \prod_j s_j(a_j) u_i(a)$
- **Nash equilibrium:**  $s^*$  is a (mixed) Nash equilibrium if

$$u_i(s_i^*, s_{-i}^*) \geq u_i(s_i', s_{-i}^*) \forall s_i'$$

# Yet Another Example

		<b>q One</b>	<b>Two</b>
<b>p</b>	<b>One</b>	2,-2	-3,3
	<b>Two</b>	-3,3	4,-4

How do we determine p and q?

# Yet Another Example

		q	One	Two
p	One		2,-2	-3,3
	Two		-3,3	4,-4

How do we determine p and q?

# Exercise

	<b>B</b>	<b>S</b>
<b>B</b>	2,1	0,0
<b>S</b>	0,0	1,2

This game has 3 Nash Equilibrium (2 pure strategy NE and 1 mixed strategy NE).

# Mixed Nash Equilibrium

- Theorem (Nash 1950): Every game in which the action sets are finite, has a mixed strategy equilibrium.

**John Nash**  
**Nobel Prize in Economics (1994)**

# Finding NE

- Existence proof is *non-constructive*
- Finding equilibria?
  - 2 player zero-sum games can be represented as a **linear program** (polynomial)
  - For arbitrary games, the problem is in **PPAD**
  - Finding equilibria with certain properties is often **NP-hard**

# Repeated Games

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10
-10,0	-1,-1

-5,-5	0,-10
-10,0	-1,-1

-5,-5	0,-10
-10,0	-1,-1

*How do we define payoffs?*

*What is the strategy space?*

# Repeated Games

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10	-5,-5	0,-10	-5,-5	0,-10	...
-10,0	-1,-1	-10,0	-1,-1	-10,0	-1,-1	

How do we define payoffs?

Average reward

Discounted Awards

...

# Repeated Games

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10	-5,-5	0,-10	-5,-5	0,-10	...
-10,0	-1,-1	-10,0	-1,-1	-10,0	-1,-1	

Strategy space becomes significantly larger!

$S:H \rightarrow A$  where H is the **history** of play so far

Can now **reward** and **punish** past behaviour, worry about reputation, establish trust,...

# Repeated Games

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10	-5,-5	0,-10	-5,-5	0,-10	...
-10,0	-1,-1	-10,0	-1,-1	-10,0	-1,-1	

**Grim Strategy:** In first step cooperate. If opponent defects at some point, then defect forever

**Tit-for-Tat:** In first step cooperate. Copy what ever opponent did in previous stage.

# Summary

Definition of a Normal Form Game
