# static SQL: pre-compile SQL for block read and write commands

## static SQL: pre-compile SQL for block read and write commands

 Table Direct Access:
 eliminate B-tree on number in favour of direct computation of tuple ID.

## static SQL: pre-compile SQL for block read and write commands

 Table Direct Access:
 eliminate B-tree on number in favour of direct computation of tuple ID.

**CONCAT SQL** aggregation function:

- aggregates logical blocks from multiple tuples
- returns data through a shared memory side channel

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## static SQL: pre-compile SQL for block read and write commands

 Table Direct Access:
 eliminate B-tree on number in favour of direct computation of tuple ID.

**CONCAT SQL** aggregation function:

aggregates logical blocks from multiple tuples

 returns data through a shared memory side channel

DECONCAT SQL scalar function: like CONCAT, but for Writes

# encryption: apply built-in ENCRYPT/DECRYPT DBMS functions to data in each tuple

### encryption: apply built-in ENCRYPT/DECRYPT DBMS functions to data in each tuple

compression: apply built-in COMPRESS/UNCOMPRESS DBMS functions to data in each tuple

# encryption: apply built-in ENCRYPT/DECRYPT DBMS functions to data in each tuple

compression: apply built-in COMPRESS/UNCOMPRESS DBMS functions to data in each tuple

#### Warning

These transformations turn fixed-length data into variable-length data. This breaks Table Direct Access.

### **Experimental Results**

- experiments compared SVM to "virtual shared disk" (VSD) in AIX
- workload provided by several block I/O request traces
- SVM had 10GB tablespace and two raw device containiners. VSD had one 10GB logical device from two physical devices.

### **Experimental Results**

- experiments compared SVM to "virtual shared disk" (VSD) in AIX
- workload provided by several block I/O request traces
- SVM had 10GB tablespace and two raw device containiners. VSD had one 10GB logical device from two physical devices.
- Without optimizations, SVM required 30 times more CPU time than VSD on reads and writes.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

### **Experimental Results**

- experiments compared SVM to "virtual shared disk" (VSD) in AIX
- workload provided by several block I/O request traces
- SVM had 10GB tablespace and two raw device containiners. VSD had one 10GB logical device from two physical devices.
- Without optimizations, SVM required 30 times more CPU time than VSD on reads and writes.
- With all optimizations, SVM and VSD CPU times were comparable (12% slowdown on writes). SVM had about a 40% latency penalty on writes, 0-10% for reads.

• Driving tacks with a sledgehammer?

- Driving tacks with a sledgehammer?
- Storage virtualization is more than a mechanism for logical-to-physical mapping. (Provisioning, management/admin tools...) Does DBMS implementation help with these?

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

### So What?

- Driving tacks with a sledgehammer?
- Storage virtualization is more than a mechanism for logical-to-physical mapping. (Provisioning, management/admin tools...) Does DBMS implementation help with these?

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

How flexible are tablespace mappings in DBMS?
