

CS 858: Software Security
Offensive and Defensive Approaches

Detection: abstract interpretation

Meng Xu (*University of Waterloo*)

Fall 2022

Outline

- 1 Introduction
- 2 Example and intuition about abstract domains
- 3 Reaching fixedpoint: joining, widening, and narrowing
- 4 Conclusion

Why this topic?

A significant portion of software security research is related to program analysis:

- derive properties which hold for program P (i.e., inference)
- prove that some property holds for program P (i.e., verification)
- given a program P , generate a program P' which is
 - in most ways equivalent to P
 - behaves better than P w.r.t some criteria(i.e., transformation)

Why this topic?

A significant portion of software security research is related to **program analysis**:

- derive properties which hold for program P (i.e., inference)
- prove that some property holds for program P (i.e., verification)
- given a program P , generate a program P' which is
 - in most ways equivalent to P
 - behaves better than P w.r.t some criteria(i.e., transformation)

Abstract interpretation provides a **formal framework** for developing program analysis tools.

Comparison with declaration programming

Q: Wait... how is abstraction interpretation different from Datalog (or declarative programming in general)?

Comparison with declaration programming

Q: Wait... how is abstraction interpretation different from Datalog (or declarative programming in general)?

- Abstraction is **implicitly** introduced in declarative rules but is **explicitly** defined in abstract interpretation.
- The search algorithm is **customizable** in abstract interpretation, but is **fixed** in declarative programming.

Disclaimer: I am not an expert in neither of these areas.

Abstract interpretation in a nutshell

Acknowledgement: the illustrations in this section is borrowed from Prof. Patrick Cousot's webpage [Abstract Interpretation in a Nutshell](#).

Program analysis: concrete semantics

The **concrete semantics** of a program is formalized by the set of **all possible executions** of this program under **all possible inputs**.

The concrete semantics of a program can be a *close to infinite* mathematical object / sequence which is impractical to enumerate.

Program analysis: safety properties

Safety properties of a program express that no possible execution of the program, when considering all possible execution environments, can reach an **erroneous** state.

Program analysis: testing

Testing consists in considering a **subset** of the possible executions.

Program analysis: bounded model checking

Bounded model checking consists in exploring the **prefixes** of the possible executions.

Program analysis: abstract interpretation

Abstract interpretation consists in considering an **abstract semantics**, that is a superset of the concrete program semantics.

The abstract semantics covers all possible cases
⇒ if the abstract semantics is safe (i.e. does not intersect the forbidden zone) then so is the concrete semantics.

Program analysis: abstract interpretation false alarm 1

False alarms caused by widening during execution.

Program analysis: abstract interpretation false alarm 2

False alarms caused by abstract domains.

Outline

- 1 Introduction
- 2 Example and intuition about abstract domains**
- 3 Reaching fixedpoint: joining, widening, and narrowing
- 4 Conclusion

What is abstract interpretation?

Consider detecting that one branch will not be taken in:

```
int x, y, z;  y := read(file);  x := y * y;
```

```
if x ≥ 0 then z := 1 else z := 0
```

What is abstract interpretation?

Consider detecting that one branch will not be taken in:

```
int x, y, z;  y := read(file);  x := y * y;
```

```
if x ≥ 0 then z := 1 else z := 0
```

- Exhaustive analysis in the standard domain: non-termination
- Human reasoning about programs – uses abstractions: signs, order of magnitude, odd/even, ...

What is abstract interpretation?

Consider detecting that one branch will not be taken in:

```
int x, y, z;  y := read(file);  x := y * y;  
if x ≥ 0 then z := 1 else z := 0
```

- Exhaustive analysis in the standard domain: non-termination
- Human reasoning about programs – uses abstractions: signs, order of magnitude, odd/even, ...

Basic idea: use **approximate** (generally **finite**) representations of computational objects to make the problem of program dataflow analysis **tractable**.

What is abstract interpretation?

Abstract interpretation is a formalization of the above procedure:

- define a non-standard semantics which can **approximate** the **meaning** (or **behaviour**) of the program in a finite way
- expressions are computed over an **approximate (abstract) domain** rather than the concrete domain (i.e., meaning of operators has to be reconsidered w.r.t. this new domain)

Example: integer sign arithmetic

Consider the domain $D = Z$ (integers)
and the multiplication operator: $* : Z^2 \rightarrow Z$

We define an “abstract domain:” $D_\alpha = \{[-], [+]\}$
and abstract multiplication: $*_\alpha : D_\alpha^2 \rightarrow D_\alpha$ defined by:

$*_\alpha$	$[-]$	$[+]$
$[-]$	$[+]$	$[-]$
$[+]$	$[-]$	$[+]$

Example: integer sign arithmetic

Consider the domain $D = Z$ (integers)
and the multiplication operator: $* : Z^2 \rightarrow Z$

We define an “abstract domain:” $D_\alpha = \{[-], [+]\}$
and abstract multiplication: $*_\alpha : D_\alpha^2 \rightarrow D_\alpha$ defined by:

$*_\alpha$	$[-]$	$[+]$
$[-]$	$[+]$	$[-]$
$[+]$	$[-]$	$[+]$

This allows us to conclude, for example, that $y = x^2 = x * x$ is never negative.

Some observations

- The basis is that whenever we have $z = x * y$ then:
if $x, y \in Z$ are approximated by $x_\alpha, y_\alpha \in D_\alpha$
then $z \in Z$ is approximated by $z_\alpha = x_\alpha *_\alpha y_\alpha$
 - Essentially, we map from an unbounded domain to a finite domain.
- It is important to formalize this notion of approximation, in order to be able to reason/prove that the analysis is correct.
- Approximate computation is generally less precise but faster (hence the tradeoff).

Example: integer sign arithmetic (refined)

Again, $D = \mathbb{Z}$ (integers)

and: $* : \mathbb{Z}^2 \rightarrow \mathbb{Z}$

We can define a **more refined** “abstract domain”

$$D'_\alpha = \{[-], [0], [+]\}$$

and the corresponding abstract multiplication: $*_\alpha : D'^2_\alpha \rightarrow D'_\alpha$

$*_\alpha$	$[-]$	$[0]$	$[+]$
$[-]$	$[+]$	$[0]$	$[-]$
$[0]$	$[0]$	$[0]$	$[0]$
$[+]$	$[-]$	$[0]$	$[+]$

Example: integer sign arithmetic (refined)

Again, $D = Z$ (integers)

and: $* : Z^2 \rightarrow Z$

We can define a **more refined** “abstract domain”

$$D'_\alpha = \{[-], [0], [+]\}$$

and the corresponding abstract multiplication: $*_\alpha : D'^2_\alpha \rightarrow D'_\alpha$

$*_\alpha$	$[-]$	$[0]$	$[+]$
$[-]$	$[+]$	$[0]$	$[-]$
$[0]$	$[0]$	$[0]$	$[0]$
$[+]$	$[-]$	$[0]$	$[+]$

This allows us to conclude, for example, that $z = y * (0 * x)$ is zero.

More observations

- There is a **degree of freedom** in defining different abstract operators and domains.
- The minimal requirement is that they be “safe” or “correct”.
- Different “safe” definitions result in different kinds of analysis.

Example: integer sign arithmetic (with addition)

Again, $D = Z$ (integers)

and now we want to define the *addition* operator $+ : Z^2 \rightarrow Z$

Example: integer sign arithmetic (with addition)

Again, $D = Z$ (integers)

and now we want to define the *addition* operator $+ : Z^2 \rightarrow Z$

We cannot use $D'_\alpha = \{[-], [0], [+]\}$ because we wouldn't know how to represent the result of $[+] +_\alpha [-]$, (i.e., the abstract addition would not be **closed**).

Example: integer sign arithmetic (with addition)

Again, $D = Z$ (integers)

and now we want to define the *addition* operator $+ : Z^2 \rightarrow Z$

We cannot use $D'_\alpha = \{[-], [0], [+]\}$ because we wouldn't know how to represent the result of $[+] +_\alpha [-]$, (i.e., the abstract addition would not be **closed**).

Solution: introduce a new element “T” in the abstract domain as an approximation of any integer.

Example: integer sign arithmetic (with addition)

New “abstract domain”: $D'_\alpha = \{-, [0], +, \top\}$

Abstract $+_\alpha : D'^2_\alpha \rightarrow D'_\alpha$

$+_\alpha$	$[-]$	$[0]$	$[+]$	\top
$[-]$	$[-]$	$[-]$	\top	\top
$[0]$	$[-]$	$[0]$	$[+]$	\top
$[+]$	\top	$[+]$	$[+]$	\top
\top	\top	\top	\top	\top

Abstract $*_\alpha : D'^2_\alpha \rightarrow D'_\alpha$

$*_\alpha$	$[-]$	$[0]$	$[+]$	\top
$[-]$	$[+]$	$[0]$	$[-]$	\top
$[0]$	$[0]$	$[0]$	$[0]$	$[0]$
$[+]$	$[-]$	$[0]$	$[+]$	\top
\top	\top	$[0]$	\top	\top

Example: integer sign arithmetic (with addition)

New “abstract domain”: $D'_\alpha = \{-, [0], +, \top\}$

Abstract $+_\alpha : D'^2_\alpha \rightarrow D'_\alpha$

$+_\alpha$	$[-]$	$[0]$	$[+]$	\top
$[-]$	$[-]$	$[-]$	\top	\top
$[0]$	$[-]$	$[0]$	$[+]$	\top
$[+]$	\top	$[+]$	$[+]$	\top
\top	\top	\top	\top	\top

Abstract $*_\alpha : D'^2_\alpha \rightarrow D'_\alpha$

$*_\alpha$	$[-]$	$[0]$	$[+]$	\top
$[-]$	$[+]$	$[0]$	$[-]$	\top
$[0]$	$[0]$	$[0]$	$[0]$	$[0]$
$[+]$	$[-]$	$[0]$	$[+]$	\top
\top	\top	$[0]$	\top	\top

We can now reason that $z = x^2 + y^2$ is never negative

More observations

- In addition to the imprecision due to the coarseness of D_α , the abstract versions of the operations (dependent on D_α) may introduce further imprecision
- Thus, *the choice of abstract domain and the definition of the abstract operators are crucial.*

Concerns in abstract interpretation

- Required:
 - Correctness – **safe approximations**: the analysis should be “conservative” and errs on the “safe side”
 - Termination – compilation should definitely terminate(note: not always the case in everyday program analysis tools!)

- Desirable – “practicality”:
 - Efficiency – in practice finite analysis time is not enough: finite *and* small is the requirement.
 - Accuracy – too many false alarms is harmful to the adoption of the analysis tool (“the boy who cried wolf”).
 - Usefulness – determines which information is worth collecting.

Outline

- 1 Introduction
- 2 Example and intuition about abstract domains
- 3 Reaching fixedpoint: joining, widening, and narrowing**
- 4 Conclusion

Abstract domain example: intervals

Consider the following abstract domain for $x \in Z$ (integers):

$x = [a, b]$ where

- a can be either a constant or $-\infty$ and
- b can be either a constant or ∞ .

Abstract domain example: intervals

Consider the following abstract domain for $x \in Z$ (integers):

$x = [a, b]$ where

- a can be either a constant or $-\infty$ and
- b can be either a constant or ∞ .

Example:

$$\{x^\# = [0, 9], y^\# = [-1, 1]\}$$

$$z = x + 2 * y$$

$$\{z^\# = [0, 9] +^\# 2 \times^\# [-1, 1] = [-2, 11]\}$$

Abstract domain example: intervals

Consider the following abstract domain for $x \in Z$ (integers):

$x = [a, b]$ where

- a can be either a constant or $-\infty$ and
- b can be either a constant or ∞ .

Example:

$$\{x^\# = [0, 9], y^\# = [-1, 1]\}$$

$$z = x + 2 * y$$

$$\{z^\# = [0, 9] +^\# 2 \times^\# [-1, 1] = [-2, 11]\}$$

Q: Why $z^\#$ is an abstraction of z ?

Join operator

The **join** operator \sqcup merges two or more abstract states into one abstract state.

Joining operator example

$\{x^\# = [0, 10]\}$

if (x < 0) then

 s := -1

else if (x > 0) then

 s := 1

else

 s := 0

Joining operator example

$\{x^\# = [0, 10]\}$

if ($x < 0$) then

$\{x^\# = \emptyset\}$

$s := -1$

$\{x^\# = \emptyset, s^\# = \emptyset\}$

else if ($x > 0$) then

$s := 1$

else

$s := 0$

Joining operator example

$\{x^\# = [0, 10]\}$

if ($x < 0$) then

$\{x^\# = \emptyset\}$

$s := -1$

$\{x^\# = \emptyset, s^\# = \emptyset\}$

else if ($x > 0$) then

$\{x^\# = [1, 10]\}$

$s := 1$

$\{x^\# = [1, 10], s^\# = [1, 1]\}$

else

$s := 0$

Joining operator example

$$\{x^\# = [0, 10]\}$$

if ($x < 0$) then

$$\{x^\# = \emptyset\}$$

$s := -1$

$$\{x^\# = \emptyset, s^\# = \emptyset\}$$

else if ($x > 0$) then

$$\{x^\# = [1, 10]\}$$

$s := 1$

$$\{x^\# = [1, 10], s^\# = [1, 1]\}$$

else

$$\{x^\# = [0, 0]\}$$

$s := 0$

$$\{x^\# = [0, 0], s^\# = [0, 0]\}$$

Joining operator example

 $\{x^\# = [0, 10]\}$

```
if (x < 0) then
```

 $\{x^\# = \emptyset\}$

```
s := -1
```

 $\{x^\# = \emptyset, s^\# = \emptyset\}$

```
else if (x > 0) then
```

 $\{x^\# = [1, 10]\}$

```
s := 1
```

 $\{x^\# = [1, 10], s^\# = [1, 1]\}$

```
else
```

 $\{x^\# = [0, 0]\}$

```
s := 0
```

 $\{x^\# = [0, 0], s^\# = [0, 0]\}$ $\{x^\# = \emptyset \sqcup [1, 10] \sqcup [0, 0] = [0, 10], s^\# = \emptyset \sqcup [1, 1] \sqcup [0, 0] = [0, 1]\}$

What about loops?

$\{x^\# = 0\}$

`x := 0`

`while (x < 100) {`

`x := x + 2`

`}`

What about loops?

$\{x^\# = \emptyset\}$

`x := 0`

$\{x^\# = \langle \text{even} \rangle\}$

`while (x < 100) {`

`x := x + 2`

`}`

What about loops?

$\{x^\# = \emptyset\}$

$x := 0$

$\{x^\# = \langle \text{even} \rangle\}$

while ($x < 100$) {

$\{x^\# = \langle \text{even} \rangle\}_1$

$x := x + 2$

$\{x^\# = \langle \text{even} \rangle\}_1$

}

What about loops?

 $\{x^\# = \emptyset\}$ `x := 0` $\{x^\# = \langle \text{even} \rangle\}$ `while (x < 100) {``{x# = ⟨even⟩}1` $\{x^\# = \langle \text{even} \rangle \sqcup \langle \text{even} \rangle = \langle \text{even} \rangle\}_2$ `x := x + 2``{x# = ⟨even⟩}1``}`

What about loops?

 $\{x^\# = \emptyset\}$ $x := 0$ $\{x^\# = \langle even \rangle\}$ $while (x < 100) \{$ $\{x^\# = \langle even \rangle\}_1$ $\{x^\# = \langle even \rangle \sqcup \langle even \rangle = \langle even \rangle\}_2$ $x := x + 2$ $\{x^\# = \langle even \rangle\}_1$ $\}$ $\{x^\# = \langle even \rangle\}$

Two iterations to reach fixedpoint (i.e., none of the abstract states changes).

Collecting semantics

$\{x^\# = \emptyset\}$

`x := 0`

`while (x < 100) {`

`x := x + 2`

`}`

Collecting semantics

 $\{x^\# = \emptyset\}$ `x := 0` $\{x^\# = [0, 0]\}$ `while (x < 100) {``x := x + 2``}`

Collecting semantics

$\{x^\# = \emptyset\}$

`x := 0`

$\{x^\# = [0, 0]\}$

`while (x < 100) {`

$\{x^\# = [0, 0]\}_1$

`x := x + 2`

$\{x^\# = [2, 2]\}_1$

`}`

Collecting semantics

 $\{x^\# = \emptyset\}$ $x := 0$ $\{x^\# = [0, 0]\}$ $\text{while } (x < 100) \{$ $\{x^\# = [0, 0]\}_1 \quad \{x^\# = [0, 0] \sqcup [2, 2] = [0, 2]\}_2$ $x := x + 2$ $\{x^\# = [2, 2]\}_1 \quad \{x^\# = [2, 2] \sqcup [2, 4] = [2, 4]\}_2$ $\}$

Collecting semantics

 $\{x^\# = \emptyset\}$ $x := 0$ $\{x^\# = [0, 0]\}$ $\text{while } (x < 100) \{$ $\{x^\# = [0, 0]\}_1 \quad \{x^\# = [0, 2] \sqcup [2, 4] = [0, 4]\}_3$ $x := x + 2$ $\{x^\# = [2, 2]\}_1 \quad \{x^\# = [2, 4] \sqcup [2, 6] = [2, 6]\}_3$ $\}$

Collecting semantics

 $\{x^\# = \emptyset\}$ `x := 0` $\{x^\# = [0, 0]\}$ `while (x < 100) {` $\{x^\# = [0, 0]\}_1 \quad \{\dots\}_4, \{\dots\}_5, \dots$ `x := x + 2` $\{x^\# = [2, 2]\}_1 \quad \{\dots\}_4, \{\dots\}_5, \dots$ `}`

Collecting semantics

 $\{x^\# = \emptyset\}$ $x := 0$ $\{x^\# = [0, 0]\}$ $\text{while } (x < 100) \{$ $\{x^\# = [0, 0]\}_1$ $x := x + 2$ $\{x^\# = [2, 2]\}_1$

}

 $\{x^\# = [0, 96] \sqcup [2, 98] = [0, 98]\}_{50}$ $\{x^\# = [2, 98] \sqcup [2, 100] = [2, 100]\}_{50}$

Collecting semantics

$$\{x^\# = \emptyset\}$$

$$x := 0$$

$$\{x^\# = [0, 0]\}$$

$$\text{while } (x < 100) \{$$

$$\{x^\# = [0, 0]\}_1$$

$$\{x^\# = [0, 96] \sqcup [2, 98] = [0, 98]\}_{50}$$

$$x := x + 2$$

$$\{x^\# = [2, 2]\}_1$$

$$\{x^\# = [2, 98] \sqcup [2, 100] = [2, 100]\}_{50}$$

$$\}$$

$$\{x^\# = [100, 100]\}$$

50 iterations to reach fixedpoint (i.e., none of the abstract states changes).

Collecting semantics

$$\{x^\# = \emptyset\}$$

$$x := 0$$

$$\{x^\# = [0, 0]\}$$

$$\text{while } (x < 100) \{$$

$$\{x^\# = [0, 0]\}_1$$

$$\{x^\# = [0, 96] \sqcup [2, 98] = [0, 98]\}_{50}$$

$$x := x + 2$$

$$\{x^\# = [2, 2]\}_1$$

$$\{x^\# = [2, 98] \sqcup [2, 100] = [2, 100]\}_{50}$$

$$\}$$

$$\{x^\# = [100, 100]\}$$

50 iterations to reach fixedpoint (i.e., none of the abstract states changes).

Q: can we reach the fixedpoint faster?

Widening operator

We compute the **limit** of the following sequence:

$$X_0 = \perp$$

$$X_{i+1} = X_i \nabla F^\#(X_i)$$

where ∇ denotes the **widening operator**.

Widening operator example

 $\{x^\# = 0\}$ `x := 0``while (x < 100) {``x := x + 2``}`

Widening operator example

$\{x^\# = \emptyset\}$

`x := 0`

$\{x^\# = [0, 0]\}$

`while (x < 100) {`

`x := x + 2`

`}`

Widening operator example

$\{x^\# = \emptyset\}$

`x := 0`

$\{x^\# = [0, 0]\}$

`while (x < 100) {`

$\{x^\# = [0, 0]\}_1$

`x := x + 2`

$\{x^\# = [2, 2]\}_1$

`}`

Widening operator example

$$\{x^\# = \emptyset\}$$

$$x := 0$$

$$\{x^\# = [0, 0]\}$$

$$\text{while } (x < 100) \{$$

$$\{x^\# = [0, 0]\}_1 \quad \{x^\# = [0, 0] \nabla [2, 2] = [0, +\infty]\}_2$$

$$x := x + 2$$

$$\{x^\# = [2, 2]\}_1 \quad \{x^\# = [2, +\infty]\}_2$$

$$\}$$

Widening operator example

 $\{x^\# = \emptyset\}$ $x := 0$ $\{x^\# = [0, 0]\}$ $\text{while } (x < 100) \{$ $\{x^\# = [0, 0]\}_1 \quad \{x^\# = [0, +\infty] \nabla [2, +\infty] = [0, +\infty]\}_3$ $x := x + 2$ $\{x^\# = [2, 2]\}_1 \quad \{x^\# = [2, +\infty]\}_3$ $\}$

Widening operator example

$$\{x^\# = \emptyset\}$$

$$x := 0$$

$$\{x^\# = [0, 0]\}$$

$$\text{while } (x < 100) \{$$

$$\{x^\# = [0, 0]\}_1 \quad \{x^\# = [0, +\infty] \nabla [2, +\infty] = [0, +\infty]\}_3$$

$$x := x + 2$$

$$\{x^\# = [2, 2]\}_1 \quad \{x^\# = [2, +\infty]\}_3$$

$$\}$$

$$\{x^\# = [100, +\infty]\}$$

3 iterations to reach fixedpoint (i.e., none of the abstract states changes).

Narrowing operator

We compute the **limit** of the following sequence:

$$X_0 = \perp$$

$$X_{i+1} = X_i \triangle F^\#(X_i)$$

where \triangle denotes the **narrowing operator**.

Narrowing operator example

$\{x^\# = \emptyset\}$

`x := 0`

$\{x^\# = [0, 0]\}$

`while (x < 100) {`

$\{x^\# = [0, +\infty]\}$

`x := x + 2`

$\{x^\# = [2, +\infty]\}$

`}`

$\{x^\# = [100, 101]\}$

Narrowing operator example

$$\{x^\# = \emptyset\}$$

$$x := 0$$

$$\{x^\# = [0, 0]\}$$

$$\text{while } (x < 100) \{$$

$$\{x^\# = [0, +\infty]\}$$

$$\{x^\# = [0, +\infty] \triangle [0, 99] = [0, 99]\}_1$$

$$x := x + 2$$

$$\{x^\# = [2, +\infty]\}$$

$$\{x^\# = [2, 101]\}_1$$

$$\}$$

$$\{x^\# = [100, 101]\}$$

Narrowing operator example

$$\{x^\# = \emptyset\}$$

$$x := 0$$

$$\{x^\# = [0, 0]\}$$

$$\text{while } (x < 100) \{$$

$$\{x^\# = [0, +\infty]\}$$

$$\{x^\# = [2, 101] \triangle [0, 99] = [0, 99]\}_2$$

$$x := x + 2$$

$$\{x^\# = [2, +\infty]\}$$

$$\{x^\# = [2, 101]\}_2$$

$$\}$$

$$\{x^\# = [100, 101]\}$$

Narrowing operator example

 $\{x^\# = \emptyset\}$ $x := 0$ $\{x^\# = [0, 0]\}$ $\text{while } (x < 100) \{$ $\{x^\# = [0, +\infty]\}$ $\{x^\# = [2, 101] \triangle [0, 99] = [0, 99]\}_2$ $x := x + 2$ $\{x^\# = [2, +\infty]\}$ $\{x^\# = [2, 101]\}_2$

}

 $\{x^\# = [100, 101]\}$

2 iterations to reach fixedpoint (i.e., none of the abstract states changes).

Outline

- 1 Introduction
- 2 Example and intuition about abstract domains
- 3 Reaching fixedpoint: joining, widening, and narrowing
- 4 Conclusion**

Conclusion

Abstract interpretation is a powerful framework for designing **correct** static analysis:

- **framework**: reusable static analysis building blocks
- **powerful**: all static analyses are understood in this framework
- **simple**: only need to define a few primitives
- **eye-opening**: any static analysis is an abstract interpretation

⟨ End ⟩
