Lecture 11: Deep Neural Networks CS480/680 Intro to Machine Learning

2023-2-14

Pascal Poupart David R. Cheriton School of Computer Science

Outline

- Deep Neural Networks
 - Gradient Vanishing
 - Rectified linear units
 - Overfitting
 - Dropout
- Breakthroughs
 - Acoustic modeling in speech recognition
 - Image recognition

Deep Neural Networks

Definition: neural network with many hidden layers

- Advantage: high expressivity
- Challenges:
 - How should we train a deep neural network?
 - How can we avoid overfitting?

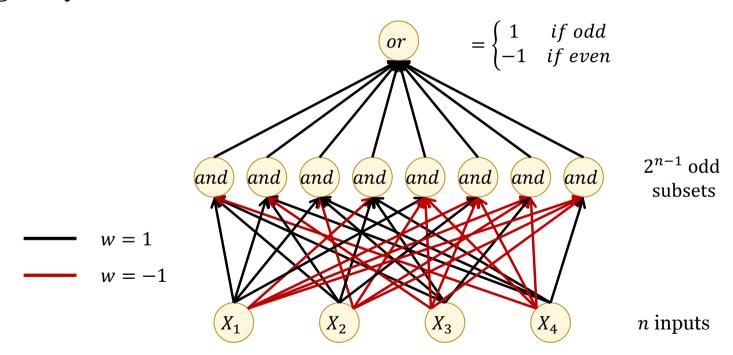

Expressiveness

 Neural networks with one hidden layer of sigmoid/hyperbolic units can approximate arbitrarily closely neural networks with several layers of sigmoid/hyperbolic units

• However as we increase the number of layers, the number of units needed may decrease exponentially (with the number of layers)

Example - Parity Function

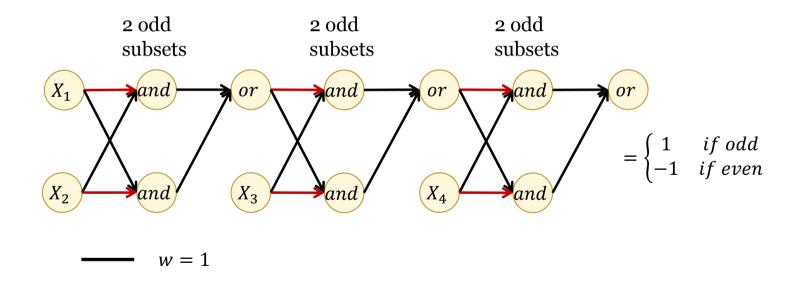

Single layer of hidden nodes

Example - Parity Function

• 2n - 2 layers of hidden nodes

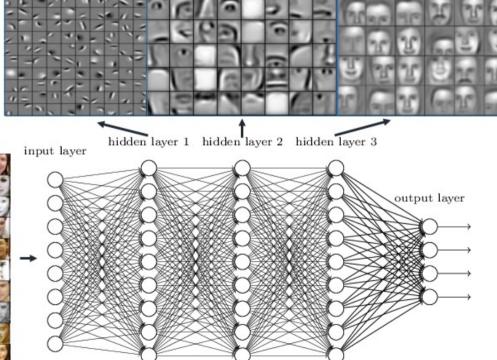

w = -1

The power of depth (practice)

Challenge: how to train deep NNs? Deep neural networks learn hierarchical feature representations

Speech

- 2006 (Hinton, al.): first effective algo for deep NN
 - layerwise training of Stacked Restricted Boltzmann Machines (SRBM)s

Speech

- 2006 (Hinton, al.): first effective algo for deep NN
 - layerwise training of Stacked Restricted Boltzmann Machines (SRBM)s
- 2009: Breakthrough in acoustic modeling
 - replace Gaussian Mixture Models by SRBMs
 - Improved speech recognition at Google, Microsoft, IBM

Speech

- 2006 (Hinton, al.): first effective algo for deep NN
 - layerwise training of Stacked Restricted Boltzmann Machines (SRBM)s
- 2009: Breakthrough in acoustic modeling
 - replace Gaussian Mixture Models by SRBMs
 - Improved speech recognition at Google, Microsoft, IBM
- 2013-2019: recurrent neural nets (LSTM)
 - Google error rate: 23% (2013) → 8% (2015)
 - Microsoft error rate: 5.9% (Oct 17, 2016) same as human performance

Image Classification

Vanishing Gradients

 Deep neural networks of sigmoid and hyperbolic units often suffer from vanishing gradients

Sigmoid and hyperbolic units

Derivatives are always less than 1

From Aidan Wilson (https://a-i-dan.github.io/math_nn)

Simple Example

$$y = \sigma \left(w_4 \, \sigma \left(w_3 \, \sigma (w_2 \, \sigma (w_1 \, x)) \right) \right)$$

$$x \longrightarrow h_1 \longrightarrow h_2 \longrightarrow h_3 \longrightarrow y$$

- Common weight initialization in (-1,1)
- Sigmoid function and its derivative always less than 1
- This leads to vanishing gradients:

$$\frac{\partial y}{\partial w_4} = \sigma'(a_4)\sigma(a_3)$$

$$\frac{\partial y}{\partial w_3} = \sigma'(a_4)w_4\sigma'(a_3)\sigma(a_2)$$

$$\frac{\partial y}{\partial w_2} = \sigma'(a_4)w_4\sigma'(a_3)w_3\sigma'(a_2)\sigma(a_1)$$

$$\frac{\partial y}{\partial w_1} = \sigma'(a_4)w_4\sigma'(a_3)w_3\sigma'(a_2)w_2\sigma'(a_1)x$$

As products of factors less than 1 gets longer, gradient vanishes

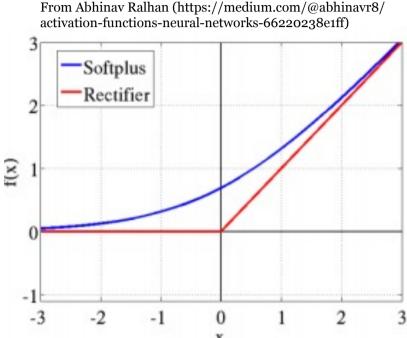

Avoiding Vanishing Gradients

- Several popular solutions:
 - Pre-training
 - Rectified linear units
 - Skip connections
 - Batch normalization

Rectified Linear Units

- Rectifier (ReLU): $h(a) = \max(0, a)$
 - Gradient is 0 or 1
 - Sparse computation
- Soft version ("Softplus"): $h(a) = \log(1 + e^a)$
- Warning: softplus does not prevent gradient vanishing (gradient < 1)

Overfitting

- High expressivity increases the risk of overfitting
 - # of parameters is often larger than the amount of data

- Some solutions:
 - Regularization
 - Dropout
 - Data augmentation

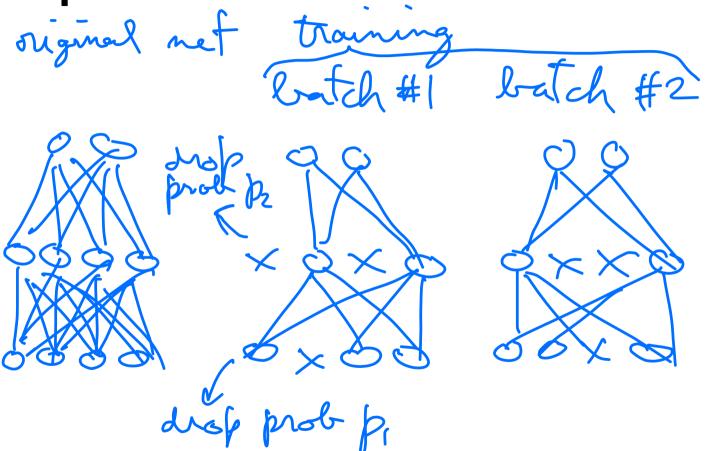

Dropout

- Idea: randomly "drop" some units from the network when training
- Training: at each iteration of gradient descent
 - Each input unit is dropped with probability p_1 (e.g., 0.2)
 - Each hidden unit is dropped with probability p_2 (e.g., 0.5)
- Prediction (testing):
 - Multiply each input unit by $1 p_1$
 - Multiply each hidden unit by $1 p_2$

Dropout Illustration

Dropout Algorithm

Training: let ⊙ denote elementwise multiplication

- Repeat
 - For each training example (x_n, y_n) do
 - Sample $\mathbf{z}_n^{(l)}$ from $Bernoulli(1-p_l)^{k_l}$ for $1 \le l \le L$
 - Neural network with dropout applied:

$$f_n(\boldsymbol{x}_n,\boldsymbol{z}_n;\boldsymbol{W}) = h_l\left(\boldsymbol{W}^{(L)}\left[\dots h_2\left(\boldsymbol{W}^{(2)}\left[h_1\left(\boldsymbol{W}^{(1)}\left[\overline{\boldsymbol{x}}_n\odot\boldsymbol{z}_n^{(1)}\right]\right)\odot\boldsymbol{z}_n^{(2)}\right]\right)\dots\odot\boldsymbol{z}_n^{(L)}\right]\right)$$

- Loss: $Err(y_n, f_n(\mathbf{x}_n, \mathbf{z}_n; \mathbf{W})$
- Update: $w_{kj} \leftarrow w_{kj} \eta \frac{\partial Err}{\partial w_{kj}}$
- End for
- Until convergence

Prediction:
$$f(\mathbf{x}_n; \mathbf{W}) = h_l(\mathbf{W}^{(L)}[...h_2(\mathbf{W}^{(2)}[h_1(\mathbf{W}^{(1)}[\overline{\mathbf{x}}_n(1-p_1])(1-p_2)])...(1-p_L)])$$

Intuition

Dropout can be viewed as an approximate form of ensemble learning

- In each training iteration, a different subnetwork is trained
- At test time, these subnetworks are "merged" by averaging their weights

Early Applications of Deep Neural Networks

- Speech Recognition
- Image recognition
- Machine translation
- Control

Acoustic Modeling in Speech Recognition

Architecture of a DNN-HMM hybrid system

TABLE III

A comparison of the Percentage Word Error Rates using DNN-HMMs and GMM-HMMs on five different large vocabulary tasks.

task	hours of	DNN-HMM	GMM-HMM	GMM-HMM
	training data		with same data	with more data
Switchboard (test set 1)	309	18.5	27.4	18.6 (2000 hrs)
Switchboard (test set 2)	309	16.1	23.6	17.1 (2000 hrs)
English Broadcast News	50	17.5	18.8	
Bing Voice Search	24	30.4	36.2	
(Sentence error rates)				
Google Voice Input	5,870	12.3		16.0 (>>5,870hrs)
Youtube	1,400	47.6	52.3	

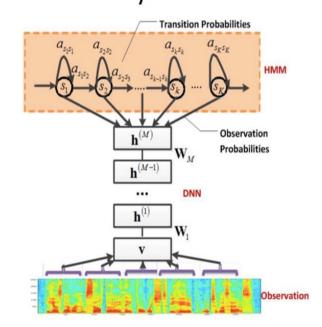

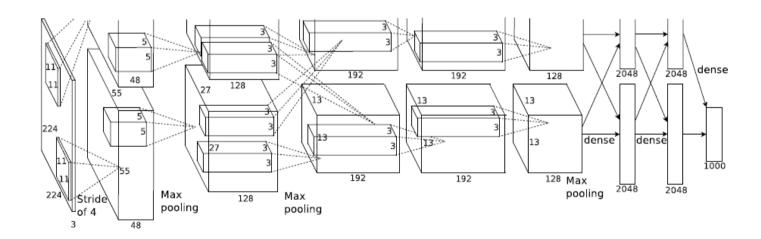

Image Recognition

- Convolutional Neural Network
 - With rectified linear units and dropout
 - Data augmentation for transformation invariance

ImageNet Breakthrough

- Results: ILSVRC-2012
- From Krizhevsky, Sutskever, Hinton

Model	Top-1 (val)	Top-5 (val)	Top-5 (test)
SIFT + FVs[7]			26.2%
1 CNN	40.7%	18.2%	_
5 CNNs	38.1%	16.4%	16.4%
1 CNN*	39.0%	16.6%	
7 CNNs*	36.7%	15.4%	15.3%

Table 2: Comparison of error rates on ILSVRC-2012 validation and test sets. In *italics* are best results achieved by others. Models with an asterisk* were "pre-trained" to classify the entire ImageNet 2011 Fall release. See Section 6 for details.

ImageNet Breakthrough

• From Krizhevsky, Sutskever, Hinton

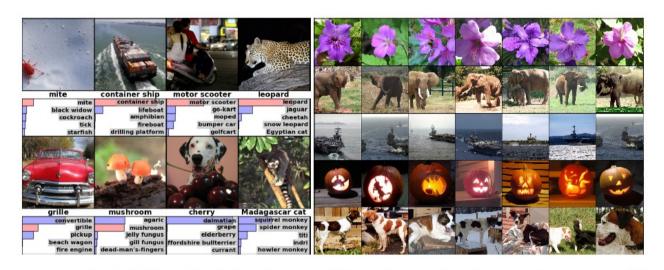

Figure 4: (Left) Eight ILSVRC-2010 test images and the five labels considered most probable by our model. The correct label is written under each image, and the probability assigned to the correct label is also shown with a red bar (if it happens to be in the top 5). (Right) Five ILSVRC-2010 test images in the first column. The remaining columns show the six training images that produce feature vectors in the last hidden layer with the smallest Euclidean distance from the feature vector for the test image.
