# Statistical Learning (part II)

October 28, 2008 CS 486/686 University of Waterloo

#### Outline

- · Learning from incomplete Data
  - EM algorithm
- · Reading: R&N Ch 20.3

CS486/686 Lecture Slides (c) 2008 P. Poupart

2

#### Incomplete data

- · So far...
  - Values of all attributes are known
  - Learning is relatively easy
- But many real-world problems have hidden variables (a.k.a latent variables)
  - Incomplete data
  - Values of some attributes missing

CS486/686 Lecture Slides (c) 2008 P. Poupart

3

# Unsupervised Learning

- Incomplete data → unsupervised learning
- Examples:
  - Categorisation of stars by astronomers
  - Categorisation of species by anthropologists
  - Market segmentation for marketing
  - Pattern identification for fraud detection
  - Research in general!

CS486/686 Lecture Slides (c) 2008 P. Pourout

2

# Maximum Likelihood Learning

- ML learning of Bayes net parameters:
  - For  $\theta_{V=true,pa(V)=\mathbf{v}}$  = Pr(V=true|par(V) =  $\mathbf{v}$ )

  - Assumes all attributes have values...
- What if values of some attributes are missing?

CS486/686 Lecture Slides (c) 2008 P. Poupart

5

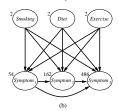

# "Naive" solutions for incomplete data

- Solution #1: Ignore records with missing values
  - But what if all records are missing values (i.e., when a variable is hidden, none of the records have any value for that variable)
- Solution #2: Ignore hidden variables
  - Model may become significantly more complex!

CS486/686 Lecture Slides (c) 2008 P. Poupart

# Heart disease example

- a) simpler (i.e., fewer CPT parameters)
- b) complex (i.e., lots of CPT parameters)

#### "Direct" maximum likelihood

- Solution 3: maximize likelihood directly
  - Let Z be hidden and E observable
  - $h_{ML}$  =  $argmax_h P(e|h)$ 
    - =  $argmax_h \Sigma_Z P(e,Z|h)$
    - =  $argmax_h \Sigma_Z \Pi_i CPT(V_i)$
    - =  $argmax_h log \Sigma_Z \Pi_i CPT(V_i)$
  - Problem: can't push log past sum to linearize product

8

#### Expectation-Maximization (EM)

- · Solution #4: EM algorithm
  - Intuition: if we knew the missing values, computing  $\mathbf{h}_{\mathrm{ML}}$  would be trival
- $\cdot$  Guess  $h_{ML}$
- Iterate
  - Expectation: based on h<sub>ML</sub>, compute
  - expectation of the missing values
    Maximization: based on expected missing values, compute new estimate of h<sub>MI</sub>

9

#### Expectation-Maximization (EM)

- More formally:
  - Approximate maximum likelihood
  - Iteratively compute:

 $h_{i+1} = \operatorname{argmax}_h \Sigma_Z P(Z|h_i,e) \log P(e,Z|h)$ 

Expectation

Maximization

10

### Expectation-Maximization (EM)

- Derivation
  - $\begin{array}{l} \text{Def Nation} \\ -\log P(\textbf{e}|\textbf{h}) = \log \left[P(\textbf{e},\textbf{Z}|\textbf{h}) / P(\textbf{Z}|\textbf{e},\textbf{h})\right] \\ = \log P(\textbf{e},\textbf{Z}|\textbf{h}) \log P(\textbf{Z}|\textbf{e},\textbf{h}) \\ = \Sigma_{\textbf{Z}} P(\textbf{Z}|\textbf{e},\textbf{h}) \log P(\textbf{e},\textbf{Z}|\textbf{h}) \\ \Sigma_{\textbf{Z}} P(\textbf{Z}|\textbf{e},\textbf{h}) \log P(\textbf{Z}|\textbf{e},\textbf{h}) \\ \geq \Sigma_{\textbf{Z}} P(\textbf{Z}|\textbf{e},\textbf{h}) \log P(\textbf{e},\textbf{Z}|\textbf{h}) \end{array}$
- · EM finds a local maximum of  $\Sigma_7 P(Z|e,h) \log P(e,Z|h)$ which is a lower bound of log P(e|h)

#### Expectation-Maximization (EM)

- · Log inside sum can linearize product
  - $\tilde{h}_{i+1}$  = argmax<sub>h</sub>  $\Sigma_Z P(Z|h_i,e) \log P(e,Z|h)$ 
    - =  $\operatorname{argmax}_{h} \Sigma_{z} P(\mathbf{Z}|h_{i},e) \log \Pi_{j} CPT_{j}$ =  $\operatorname{argmax}_{h} \Sigma_{z} P(\mathbf{Z}|h_{i},e) \Sigma_{j} \log CPT_{j}$
- · Monotonic improvement of likelihood -  $P(e|h_{i+1}) \ge P(e|h_i)$

## Candy Example

- Suppose you buy two bags of candies of unknown type (e.g. flavour ratios)
- You plan to eat sufficiently many candies of each bag to learn their type
- Ignoring your plan, your roommate mixes both bags...
- How can you learn the type of each bag despite being mixed?

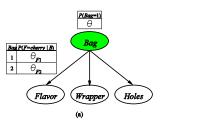

CS486/686 Lecture Slides (c) 2008 P. Poupar

13

15

### Candy Example

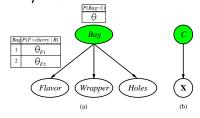

· "Bag" variable is hidden

486/686 Lecture Slides (c) 2008 P. Poupart

# Unsupervised Clustering

- · "Class" variable is hidden
- · Naïve Bayes model

ture Slides (c) 2008 P. Poupart

# Candy Example

- Unknown Parameters:
  - $-\theta_i = P(Bag=i)$
  - $\theta_{Fi}$  = P(Flavour=cherry|Bag=i)
  - $\theta_{Wi}$  = P(Wrapper=red|Bag=i)
  - $\theta_{Hi}$  = P(Hole=yes|Bag=i)
- When eating a candy:
  - F, W and H are observable
  - B is hidden

CS486/686 Lecture Slides (c) 2008 P. Poupart

16

14

# Candy Example

- · Let true parameters be:
  - $\theta$ =0.5,  $\theta_{F1}$ = $\theta_{W1}$ = $\theta_{H1}$ =0.8,  $\theta_{F2}$ = $\theta_{W2}$ = $\theta_{H2}$ =0.3
- · After eating 1000 candies:

	W=red		W=green	
	H=1	H=0	H=1	H=0
F=cherry	273	93	104	90
F=lime	79	100	94	167

CS486/686 Lecture Slides (c) 2008 P. Pourset

17

# Candy Example

- · EM algorithm
- Guess h₀:
  - $\theta$ =0.6,  $\theta_{\text{F1}}$ = $\theta_{\text{W1}}$ = $\theta_{\text{H1}}$ =0.6,  $\theta_{\text{F2}}$ = $\theta_{\text{W2}}$ = $\theta_{\text{H2}}$ =0.4
- · Alternate:
  - Expectation: expected # of candies in each bag
  - Maximization: new parameter estimates

CS486/686 Lecture Slides (c) 2008 P. Poupart

## Candy Example

- Expectation: expected # of candies in each bag
  - #[Bag=i] =  $\Sigma_i P(B=i|f_i,w_i,h_i)$
  - Compute P(B=i|fj,wj,hj) by variable elimination (or any other inference alg.)
- · Example:
  - #[Bag=1] = 612
  - #[Bag=2] = 388

CS486/686 Lecture Slides (c) 2008 P. Poupart

19

### Candy Example

- Maximization: relative frequency of each bag
  - $-\theta_1 = 612/1000 = 0.612$
  - $-\theta_2 = 388/1000 = 0.388$

CS486/686 Lecture Slides (c) 2008 P. Poupart

20

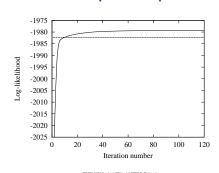

# Candy Example

- Expectation: expected # of cherry candies in each bag
  - #[B=i,F=cherry] =  $\Sigma_i$  P(B=i| $f_i$ =cherry, $w_i$ , $h_i$ )
  - Compute P(B=i|fj=cherry,wj,hj) by variable elimination (or any other inference alg.)
- · Maximization:
  - $-\theta_{F1} = \#[B=1,F=cherry] / \#[B=1] = 0.668$
  - $\theta_{F2}$  = #[B=2,F=cherry] / #[B=2] = 0.389

CS486/686 Lecture Slides (c) 2008 P. Poupart

21

#### Candy Example

22

# Bayesian networks

- · EM algorithm for general Bayes nets
- Expectation:
  - $\#[V_i=v_{ij},Pa(V_i)=pa_{ik}]$  = expected frequency
- · Maximization:
  - $-~\theta_{\mathsf{v}_{ij},\mathsf{p}\mathsf{a}_{ik}} = \#[\mathsf{V}_i \mathtt{=} \mathsf{v}_{ij},\!\mathsf{Pa}(\mathsf{V}_i)\mathtt{=}\mathsf{pa}_{ik}]~/~\#[\mathsf{Pa}(\mathsf{V}_i)\mathtt{=}\mathsf{pa}_{ik}]$
