- KEYGEN
- 1 choose  $p, q \xleftarrow{R} \mathbb{P}$
  - 2 set  $n := p \cdot q$
  - 3 find  $e, d$  with  $e \cdot d \equiv 1 \pmod{\varphi(n)}$
  - 4  $pk = (e, n), sk = d$

$$\text{ENC}(pk, m) \quad c \equiv m^e \pmod{n}$$

$$\text{DEC}(sk, c) \quad m \equiv c^d \pmod{n}$$

## Homomorphic Property

$$\begin{aligned} \text{ENC}(pk, m_1) \cdot \text{ENC}(pk, m_2) &\equiv m_1^e \cdot m_2^e \\ &\equiv (m_1 \cdot m_2)^e \\ &\equiv \text{ENC}(pk, m_1 \cdot m_2) \end{aligned}$$

**Problem:** Textbook RSA is deterministic.

- KEYGEN
- 1 multiplicative group  $(G, \cdot)$  with generator  $g$
  - 2 choose  $x \xleftarrow{R} \{1, \dots, |G|\}$
  - 3 set  $y := g^x$
  - 4  $pk = y, sk = x$

$$\text{ENC}(pk, m) \quad r \xleftarrow{R} \{1, \dots, |G|\}, (c_1, c_2) = (g^r, y^r \cdot m)$$

$$\text{DEC}(sk, (c_1, c_2)) \quad m = c_2 \cdot (c_1^x)^{-1}$$

## Homomorphic Properties

$$\begin{aligned} \text{ENC}(pk, m_1) \cdot \text{ENC}(pk, m_2) &= (g^{r_1}, y^{r_1} \cdot m_1) \cdot (g^{r_2}, y^{r_2} \cdot m_2) \\ &\equiv (g^{r_1+r_2}, y^{r_1+r_2} \cdot m_1 \cdot m_2) \\ &\equiv \text{ENC}(pk, m_1 \cdot m_2) \\ (1, n) \cdot \text{ENC}(pk, m) &= (g^r, n \cdot y^r \cdot m) \\ &\equiv \text{ENC}(pk, n \cdot m) \end{aligned}$$

**Problem:** ElGamal is not deterministic, but malleable.

- KEYGEN
- 1 choose  $p, q \xleftarrow{R} \mathbb{P}$
  - 2 set  $n := p \cdot q$
  - 3 find  $e, d$  with  $e \cdot d \equiv 1 \pmod{\varphi(n)}$
  - 4  $sk = e, vk = (d, n)$

SIGN( $sk, m$ )  $s \equiv m^e \pmod{n}$

VERIFY( $vk, m, s$ )  $m \stackrel{?}{\equiv} c^d \pmod{n}$

- 1 Alice chooses masking  $c$  and sends  $\tilde{m} = c^d \cdot m$  to Bob.
- 2 Bob signs  $\tilde{m}$  and sends signature  $\tilde{s} = \tilde{m}^e$  to Alice.
- 3 Alice removes masking from  $\tilde{s} = \tilde{m}^e = c^{ed} \cdot m^e$  and obtains  $s = \tilde{s} \cdot c^{-1} = m^e$  as a signature for  $m$ .

COMMIT Commit to a value  $m$ .

OPEN Open a commitment  $c$  to a value  $m$ .

# Commitment Scheme from Hash Function

- SETUP Choose keyed hash function  $h(\cdot, \cdot)$ .
- COMMIT Commit to  $m$  by choosing randomness  $r$  and sending  $c = h(r, m)$ .
- OPEN Send preimages  $r, m$  to commitment  $c$ .

## Properties

- binding from collision resistance
- hiding from one-way property

- SETUP Choose multiplicative group  $(G, \cdot)$  with generators  $g, h$ .
- COMMIT Commit to  $m$  by choosing randomness  $r$  and sending  $c = g^r \cdot h^m$ .
- OPEN Send  $m$  and  $r$ .

## Properties

- binding *dlog-assumption*:  $\log_g h$  is hard to compute
- hiding unconditionally binding

The signed credential contains commitments to values. The issuer signs the credential blind.

J. Holt, K. Seamus: *Selective Disclosure Credential Sets*

Proofer Peggy knows an isomorphism  $\Phi$  between two graphs  $G_0$  and  $G_1$  and wants to prove this to verifier Victor.

## Protocol

- 1 Peggy chooses isomorphism  $\Psi \xleftarrow{R}$  and sends  $G' = \Psi(G_0)$  to Victor.
- 2 Victor chooses challenge bit  $b \xleftarrow{R} \{0, 1\}$ .
- 3  $b = 0$  Peggy sends  $\Psi$  to Victor.  
 $b = 1$  Peggy sends  $\Psi \circ \Phi$  to Victor.

After  $k$  runs Victor is convinced Peggy knows  $\Phi$  without getting any more information.
